Source record: 17323

I tried on a couple of good (60+ deg Max El) passes last weekend
with a DJ-580 and a Premier AL-800 long whip. I could hear the
sat just fine, but I couldn't hit it. I suspect that I'm suffering
from "tree attenuation", since I couldn't hear the sat until it
was well into its pass, but oh, the things I heard! Standing in
my driveway (Merrimack, NH) I heard Jacksonville, FL, Toronto,
North Dakota, and Texas! It was quite frustrating to not be able
to hit the bird. I kept the RX tuned to 436.795 throughout, so
maybe I need to tune around a bit to correct for doppler, too.

Last night, I assembled a Cushcraft A270-6S yagi. It's a little
under a yard long, and it has 3 elements on 2M and 3 elements on
70cm. It cost $59.95 at HRO, and it's reasonably light enough to
hand-hold (at least for me.) I'm hoping that the ~8dBd of gain
will be enough to get me into AO-27 without having to resort to
a power amp and pre-amp.

I wasn't aware that AO-27 is available on weekdays. All of the
info I've seen (mostly web pages that haven't been updated in
several months) says weekends only, with weekdays and nights on an
ad-hoc basis. Are we in the middle of an "ad-hoc?" Where can I
go to find the latest info?

Tomorrow's daytime passes are a bit low for me (MEL of 48.5 at 1006
and 23.5 at 1146 EST), but I may go outside and wave the beam around
just to see if I can hear anything. I get a couple more low ones on
Friday morning, a 66 deg MEL at 1052 EST on Saturday, and a nice, high
73.1 at 1025 EST Sunday. Maybe you'll finally hear me!

With RS-12 switched into Mode A, AO-27 is the only satellite I can
work with my current equipment. Does anyone know of any other bird
running Mode K (15M up/10M down) so I can try to wear out the band
switch on my IC-730 HF Transceiver? ;-) Maybe I'll try mic-keying
to put an ugly CW signal into RS-12...

2. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1998-01-01 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <68eob3$23l$1@blackbird.afit.af.mil>
Source record: 17324

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from

archive.afit.af.mil (129.92.1.66)

in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-four character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01 Line Number of Element Data
03-07 Satellite Number
08 Classification (U=Unclassified)
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Day of the year and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
45-52 Second Time Derivative of Mean Motion (decimal point assumed)
54-61 BSTAR drag term (decimal point assumed)
63 Ephemeris type
65-68 Element number
69 Checksum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69 Checksum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 14
1 23455U 94089A 97320.90946019 .00000140 00000-0 10191-3 0 2621

I've wondered about this business of recieve-only antennas and the
need for baluns in those circumstances. You educated me on the proper
understanding of the cause of common mode currents on the outer
shield, but I had not yet figured out the effects, if any, on receive
systems.
>Antenna systems are reciprocal. If a balun is required for transmit, it
>is also required for reception. The effect of the imbalance on reception

...snip...
> The main effect
>for reception is to reduce the antenna pattern nulls. This could be bad if
>you are using the nulls to reject an interfering station. (You don't face
>the "hot shack" problem with a receive only setup, but the effect on
>pattern remains.)
So, when your post popped up here, it forced me to try to look more
closely at the receive situation.

Repairing back to your explanations of what happens at the
balanced/unbalance junction, I assume that an incoming signal from the
dipole can be thought of as driving the transmission line with a
differential signal (across the inner conductor and the inner surface
of the shield). The outer surface of the coax, however, becomes an
additional path for currents that are generated by virtue of the RF
voltage at the junction relative to earth - so called common mode
currents (something that would happen in this situation with an
unbalanced line but would not happen with a balanced line, unless some
other mechanism prevails).

OK, so I am satisfied now, after giving it some serious thought, that
the mechanism would be reciprocal. Again, I am in your debt. There's
nothing that I appreciate more than getting this straight in my mind.
The thing that I have always liked about teaching is that you usually
learn your subject better by trying to instruct someone else than you
do alone - and it's still true.

> But he will need a tuner at the receiver end to provide
>a conjugate match, and to provide the balun function for the receiver.
>Just using coax feed with a balun at the antenna would be simpler
>at the frequency where the antenna is resonant, but at all other
>frequencies, he'll need the tuner anyway, so he might as well use
>the lower loss feedline he already has instead of hunting up some
>coax.

I wouldn't argue with that at all - in general. However, since the
original article claimed he was only designing for 10 meters, I stuck
with that. It seems that you can't win for trying.

From: John Mock <kd6pag@nospam.mocha.ecofe.com>
Message-ID: <4mzplg6pew.fsf@spinner.ecofe.com>
Source record: 17327

Heard the safex repeater on the MIR today in coastal North Carolina
is it back on or was it a mirage....

It's back (at least for the moment, see my other posting). They've worked on it as well, as it now has a much longer squelch tail, which is a big help for those of us tuning by ear rather than working with a tracking program. (For example, my PowerBook tends to QRM my receiver, so i prefer to leave it off if i'm not using a directional antenna.) I worked another station in California that morning, and heard several others, including UT, IN, and CO. We only have a few minutes of overlap with you out in California, so i don't expect to work you on Mir/SAFEX (but AO-27 is possible and i could use NC).

73's and good luck,

-- KD6PAG (Networking Old-Timer, RF newbie)

Thanks for the update, John. I'll now be toting my beam to work
with me to try for AO-27 during the week. I hope to work you.

Hmmm. www.umbra.com shows me a surrealistic face with an animated
graphic talking about what "it wants." There appears to be no way
to access sub-pages. I tried ftp://www.umbra.com to try to find
sub-pages, but it looks like the directory permissions are clamped
down so I can't see anything. There is a single line of text at
the bottom of the page saying that "The Room" at www.umbra.com will
be opening January 1998. Is there a specific page at www.umbra.com
that has the AO-27 info?

10. What if ??

Newsgroup: rec.radio.amateur.space
Date: 1998-01-02 00:00:00 UTC
From: David Perdew <David.Perdew@bridge.bellsouth.com>
Message-ID: <34AD0DAC.9B2C08A3@bridge.bellsouth.com>
Source record: 17233

I was listening to a Richard Wolfson lecture series on relativity (I'm a writer, not a scientist.) And the discussion was about the gravitational effects of the moon on the earth and the earth on the moon.

As a writer who is always asking "What if?", I began wondering what would happen if the moon slowly began moving away from the earth because of a stronger gravitational pull from some other object. For example: we know the moon affects the tides. How would the change in tides affect sea life? How would that affect our entire ecological system? How would the change in the moon affect our moods?

I know it's kind of a silly question, but from a fiction standpoint, I'm intrigued.

Any ideas?

David

Hi all,

I would appreciate your comments and suggestions of what you think of my new web site. The topics covered are SETI at home project, The international space station and various other space matters, also it has NASA tv live aswell as some of the other KSC and nasa cams live. If you like there is a page for live up to date news via real video tv I hope to make it a very informative site with up to date info and quality content, obviously a few of the areas covered will not be fully operational until spring and june of 1998.

I look forward to your comments and ideas...you can webmail me with them from the index of the site

Thanks
Ian Koenig.

Here's a thought. Make your folded dipole entirely out of the ladder
line then match it to your receiver through a simple 4:1 balun.

Sorry, but I think that would be bad advice. Using an antenna
constructed of 450 ohm ladder line does not necessily provide an
impedance match with a 450 ohm ladder line.

Furthermore, whatever mismatch may occur at the point where the ladder
line attaches to the antenna is going to produce an SWR on the ladder
line. That is no problem in itself, but it means that you would have
a range of impedances all over the map at the point where you connect
the rig. Therefore, a 4:1 balun at the rig may or may not provide a
match. It is equally likely that some particular length of line would
require a 1:4 balun instead of a 4:1 balun.

You have to know the antennas impedance at the frequency of operation
ant the length of the ladder line transmission line in order to know
what impedance it will present at the rig.

The implication in your suggestion is that there will be a match
between portions of a system just because you are using material that
has the same characteristic impedance. That is in my opion very
misleading and propagates a misunderstanding of what is important in
designing antenna / transmission line systems.

Yep, I'd say the same.
BTW to convert from pounds (GBP) into dollars (USD) multiply the GBP
price by about 1.62 at the current rate to get dollars cost.
So you are looking at around $267, plus import taxes and carriage.
Import duty here in the UK is around 5% of the value of the item(s)
plus we get to pay 17.5% of the value to the taxman. Ripper!

=========
SpaceNews
=========

MONDAY JANUARY 5, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* SPUTNIK-40 NEWS *
==================
Reports received from across the globe confirm that the Sputnik-40/RS-17
satellite has gone silent. Sputnik-40 was released from the Mir space
station on 03-Nov-97, and was operational up until the end of 1997.
The satellite remained operational for a period of time that exceeded
all expectations. Reception of its beacon transmitter was confirmed
by ground stations worldwide using even very modest receiving equipment.

* AO-16 S-BAND NEWS *
====================
Jim White, WD0E, recently reported that AMSAT-OSCAR-16's S-Band beacon
transmitter has been turned off. Several weeks ago spacecraft controllers
had it on for some testing and confirmed that the satellite does not have
the power budget to keep the S-Band beacon and the 70 cm transmitter on
at a power level that supports entry level ground station operations.
The 437.05 MHz 70-cm transmitter has to be run at about 0.5 watts to
allow the S-Band transmitter to remain on. Any higher than that and
the spacecraft software turns the S-Band transmitter off to maintain
a safe battery voltage.

Ground stations interested in testing S-band receive equipment can use
either the DOVE-OSCAR-17 S-Band transmitter on 2401.220 MHz or the
UoSAT-OSCAR-11 S-Band transmitter.

* MIR NEWS *
============
The Orbital Report On-Line reports that a TsSKB-Progress Soyuz U vehicle
was launched from Baykonur, Kazakhstan, on 20-Dec-97, to loft the Progress
M37 cargo spacecraft to the Mir space station. The 7,195-kg spacecraft,
carrying 2,500 kg of supplies, docked with the station on 22-Dec-97.
```

The 72-kg Inspektor sub-satellite failed shortly after deployment from the Progress M36 cargo spacecraft leaving the Mir space station on 17-Dec-97. The US $15-million spacecraft built by Daimler-Benz Aerospace (DASA) of Bremen, Germany, was intended to maneuver around the station for a 30-hour external inspection mission. Unfortunately, due to a faulty attitude sensor, the Inspektor pointed its camera in the wrong direction and could not image the station.

Miles Mann, WF1F, reports that Mir's 2-meter amateur radio station was temporarily moved from the core module and installed in the Priroda module. This move was performed to take advantage of the backup triband antenna shared with the SAFEX II 70-cm FM repeater installed on Mir. Although a new packet radio TNC was installed on Mir several weeks ago, not all the TNC parameters have been properly configured. MIREX has asked that ground stations monitoring the Mir Personal Message System (PMS) to please be patient while the necessary adjustments are made.

The SAFEX repeater has been active on an intermittent basis. Last week, the crew turned off the PL tone feature of the repeater, thereby making it easier for weak stations to access the repeater. This change also makes the repeater to transmit static for long periods of time followed by short time-outs. Users are asked to compensate for Doppler Shift for EACH transmission. The following chart may be used as a guide:

Downlink Uplink split
437.959 MHz 435.741 MHz 2.218 MHz
437.958 MHz 435.742 MHz 2.216 MHz
437.956 MHz 435.744 MHz 2.212 MHz
437.954 MHz 435.746 MHz 2.208 MHz

Mode KA is the 21 MHz and 145 MHz receivers active into the 10m downlink.

K uplink = 21.210 - 21.250
A uplink = 145.910 - 145.950
KA downlink = 29.410 - 29.450

KT was 21 MHz uplink with downlinks in the 10m AND 2m bands. That is NOT
what's happening, now.

Yes, I confirmed for myself that the 15-Meter uplink is once again
operational. Whew! I thought we'd lost our only HF satellite. This
is a much better arrangement, though. It allows Technicians/Tech Plus/
Generals access on 2-Meters as well as the Advanced/Extras uplink
on 15-Meters.

The passbands are as follows:

Uplinks:

145.910 ----------145.950
21.210 ------------21.250 (Advanced and Extra portion of 15-Meters)

Downlink:

29.410 ------------29.450

For more information, check out:

http://oeonline.com/~kf8bex/index.html

Mike, N8MR
WAS OSCAR CW #238 (most of which came from RS-12 Mode-K)

28. Re: RS-12 in Mode KA

Newsgroup: rec.radio.amateur.space
Date: 1998-01-03 00:00:00 UTC
From: John Mock <kd6pag@nospam.mocha.ecofe.com>
Message-ID: <4m1zyo3lrr.fsf@spinner.ecofe.com>
Source record: 17250

It appears that RS-12 has been commanded on to Mode KA: on
1/3/98 at 0750 UTC, Orbit #34664, RS-12 was in KA when K5PK/4
(Mode K) and I (N5WD Mode A) QSO'ed. Welcome back!

Before, i believe it was in KT mode (Uplink 21.21-21.25 MHz CW/SSB,
Downlink 29.41-29.45 MHz or 145.91-145.95 Mhz CW/SSB), so it sounds
like its in mode KA *instead* of mode A or KT.

What is mode KA? I know what Mode A is and what mode KT is what is Mode KA?
Is that 15 up and 10 down? On the last pass I heard lots of signals but
I wasn't able to hear myself. What are the passbands for Mode KA?

Mode A is 2M uplink, 10M downlink. Mode K is 15M uplink, 10M downlink.
So presumably KA is 10M downlink with either 2M or 15M uplink. AMSAT.ORG
should have the current passbands, which are probably those listed above
(with the relevant uplink and downlink swapped).

73's and good luck!

Dear Sir, Yes, so many friends ask me the same questions in BV. I do
my set up and fine tuning of my partial homebrew station for APT. I
enjoy it not only the picture slowly appear on the screen, but also
improved of my interpretation of the raw data compared with that of the
TV.
It improved my technique and my horizon.

It WAS neat to hear it. I'm glad I taped it as well. It was only supposed
to last a month or so anyway but what a neat little sat!

It's supposed to burn up in about a year or so....

Dear Folks:

I work RS-12 on Mode A on CW from Denver. I recently worked a pass in which I (and those I was working) were frequently wiped out by the splatter coming from the SSB ops. I assume (perhaps erroneously) that the splatter is coming from the SSB ops on the 15 meter uplink (I guess it doesn't really matter where it's coming from - I just think it's from them because RS-12 just moved into Mode KA, and I hadn't heard such splatter before then). Could you guys do something about that, i.e., turn down the mike gain? I'm sure you will still be heard.

HI!
I have 2 antennas 22xb on the band 144 mHz and 2 antennas
738xb on the band 430 mHz, firm CUSHCRUFT.
I think to establish on one boom a this system 2x144 plus 2x430 mHz.
Which distance between antennas I should establish?
Thank you!

Reports from around the world appear to confirm that the Sputnik PS2 mini-satellite has stopped transmitting. The beacon signal from the working model of the original Sputnik 1 satellite was last monitored on December 29 or 30. The lithium battery-powered 100 mW transmitter had continued working for eight weeks after its launch by hand from the Russian Mir space station on November 3, transmitting a beep-beep tone on 145.82 MHz, and many hams around the globe had continued to track the satellite's progress. The frequency of the tone indicated the satellite's internal temperature. Recent reports from stations monitoring the Sputnik PS2 indicated its signals were getting weaker.

Students from the FR5KJ radio club at Jules Reydellet College in St. Denis, Reunion Island, and at the Polytechnic Laboratory of Nalchik Kabardine in Russia cooperated in building the mini-Sputnik. The Russian students built the satellite body, while the French students fabricated the transmitter inside. Two working models of the Sputnik were assembled and transported to Mir, but only one was launched. The Sputnik PS2, also called RS-17, surpassed the life of its original namesake by several weeks. The little satellite was a one-third scale model of the original and had been estimated to remain in operation for approximately 40 days.

As of December 31, the satellite had not been officially declared dead, however.

[ANS thanks the ARRL for this report.]

200TH HOUSTON AMSAT NET

HR AMSAT NEWS SERVICE BULLETIN 004.02 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 04, 1998

TO ALL RADIO AMATEURS BT
BID: $ANS-004.02

January 6, 1998 will mark the 200th time the Houston AMSAT Net has been transmitted over commercial satellite. (the net has been going on much longer than that).

To celebrate, they will have live interviews with Bill Tynan, W3XO (president AMSAT-NA), Keith Baker, KB1SF (executive vice president of AMSAT-NA), Stan Wood, WA4NFY(board of director AMSAT-NA and P3D engineer), Lou McFadin (manager P3D integration lab), W5DID, Frank Bauer, KA3HDO (vice president of manned space flight AMSAT-NA).

What might be discussed? P3D integration, P3D launch, International Space Station (ISS) and SAREX, the future of satellites? You will have to listen in to find out.

Also a little bit of trivia about the net will also be on the agenda besides the regular bulletins and information.

You can join them on KU-band satellite Hughes SBS6, T13B, 6.2 MHz wide band audio and also for their live Real Audio feed at
http://www.amsatnet.com
They use 28.8 mono encoding and it sounds excellent.

[ANS thanks Bruce Paige, KK5DO, AMSAT Area Coordinator for this information.]

SB SAT @ AMSAT $ANS-004.03
FIND EARTHWATCH SPACECRAFT

HR AMSAT NEWS SERVICE BULLETIN 004.03 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 04, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-004.03

AMSATers, particularly those in the Southern Hemisphere are asked to help find the EARTHWATCH Spacecraft. It was launched from Russia just before Christmas and apparently stopped transmitting sometime Christmas day. Rex Richardson of Orbital Sciences Corp. has asked for our help. It is they who are to conduct the thermal vacuum testing for Phase 3D. So, we owe it to them to try to help them if we can.

The EARTHWATCH spacecraft parameters are as follows:

Frequency: 401.5 MHz
Modulation FSK @ 192000 BPS (I believe it is a burst at a 1 sec rep rate)

The Ephemeris sets are as follows:
NORAD TWO LINE ELEMENTS:

1. 25123U 97085A 97363.20916818 +.00003168 +0.0000-0 +12102-3 0 00353

SB SAT @ AMSAT $ANS-004.04
AO-16 S BAND OFF

HR AMSAT NEWS SERVICE BULLETIN 004.04 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 04, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-004.04

Jim White, WD0E, informs the ANS that AO-16 S band transmitter is off. About three weeks ago they had it on for some testing and confirmed AO-16 does not have the power budget to keep it on and keep the 70 cm transmitter at a power level that supports entry level ground station operations. The 437.05 MHz transmitter has to be run at about .5 W to allow the S transmitter to remain on. Any higher than that and the software turns the S off to maintain a safe battery voltage.

Folks interested in testing S receive equipment can use either the DOVE S transmitter on 2401.220 MHz or the UO-11 S transmitter. For further, see the most recent AMSAT Journal or the article on the AMSAT-NA WEB page.

[ANS thanks Jim White, WD0E, for this update.]

ANTARCTICA ON UO-22

HR AMSAT NEWS SERVICE BULLETIN 004.05 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 04, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-004.05

For those who haven't been following Ron Ross' ,KE6JAB, adventures in Antarctica on UO-22, his narratives and photos are on http://www.thistle.org. There are 4 photos there now, one is there but not posted yet, and one on UO-22 that will be downloaded and posted soon. He plans to try KO-25 also, but has had limited success there on the uplink.

Ron is using an IC-821, a small storage battery which he recharges with solar cells, a laptop PC running WiSP16, and two eggbeater antennas mounted on six foot poles stuck in the snow about 20 feet apart.

[ANS thanks Roy Welch, W0SL, for this news.]

RS-12
(Uplink, 145.91-145.95 MHz CW/SSB, Downlink 29.41-29.45 MHz)
Operational, now in mode KA.
Wayne Day, N5WD, tells the Amsat News Service that
on 1/3/98 at 0750, K5PK (Mode K) and Wayne (Mode A) QSO'ed on RS-12's orbit # 34664. He mentioned that he noticed a message on his local packet system that mentioned that RS-12 was back into Mode K.
Wayne Day, N5WD,

RS-15
(Uplink 145.858-145.898 MHz CW/SSB, Downlink 29.354-29.394 MHz CW/SSB)
Operational.

RS-16
At this time only the beacons are on.
Transponder information on RS-16.
Uplink = 145.915 - 145.948 MHz
Downlink = 29.415 - 29.448 MHz
Beacons = 29.408 and 29.451 MHz
Pwr 29 MHz Down = 1.2 W /4 W

Beacon 1 = 435.504 MHz
Beacon 2 = 435.548 MHz
Pwr 435 MHz Beacons = 1.6 W

RS-17
As of December 31, although the satellite had not been officially declared dead, a number of observers has reported its 145.820 MHz missing.
New Sputnik-40 QSL Address QSL Information is as follows:
QSL Information for SWL (Short Wave Listener)

Sergey Samburov (RV3DR)
P.O. Box 73
Korolev-10 City
141070, Russia
[ANS thanks the MIREX team for this information]

AO-10
(Uplink 435.030-435.18 MHz CW/LSB, Downlink 145.975-145.825 MHz CW/USB)
Operational.

AO-27
(Uplink 145.85 MHz FM, Downlink 436.792 MHz FM)
Operational
[ANS thanks Michael Wyrick, N4USI, AO-27 Control-op, for this update]

FO-20
(Uplink 145.9-146.0 MHz CW/LSB, Downlink 435.8-435.9 MHz CW/USB)
Operational. FO-20 in mode JA continuously.
FO-20, like many Leo's is in a "sun synchronous" orbit. The precession in the RAAN of its orbit due to the earth's oblateness matches the earth's rotation around the sun so that FO-20 always has about 33 minutes of eclipse time each orbit and the rest in sunshine. A sun synchronous orbit is a retrograde LEO polar orbit with an inclination of about 98 degrees. At this inclination RAAN precession = 360 degrees in 365 days. The stability in temperature and solar energy is, needless to say, very helpful. The ratio of eclipse to sunlight can be adjusted by varying initial orbital elements. FO-29, for example, is virtually always in sunlight, UO-11 has about 22 minutes of eclipse, most seem to run about 33 minutes eclipse per orbit.

This also means that FO-20 (and other sun synchronous sats) appear at your location at about the same "sun time" every day. At my QTH FO-20 goes over about 1:30 PM and 3:30 PM every day. UO-11, AO-16, DO-17, WO-18, LO-19, UO-22, KO-25, AO-27, FO-29 etc are also in sun synchronous orbits. KO-23,

RS-12/13, RS-15, though in highly inclined orbits, are not sun synchronous.
[ANS thanks Stacey Mills, W4SM, and Kazu Sakamoto, JJ1WTK, for this report]

SB SAT @ AMSAT $ANS-004.07
WEEKLY SATELLITE REPORT PT 2

HR AMSAT NEWS SERVICE BULLETIN 004.07 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 04, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-004.07

KO-23
(Uplink 145.85, 145.9 MHz FM, Downlink 435.175 MHz FM,
9600 Baud FSK)
KO-23 operating normally.
[ANS thanks Jim Weisenberger, AA7KC, for this report]

KO-25
(Uplink 145.980 MHz FM, Downlink 436.5 MHz FM, 9600 Baud FSK.)
KO-25 operating normally.
[ANS thanks Jim Weisenberger, AA7KC, for this report]

OSCAR-11
(Downlink 145.825 MHz. FM, 1200 Baud PSK. Beacon 2401.500 MHz)
Operating normally.
The operating schedule is unchanged.

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)

BINARY ENG (30 seconds)

There are also additional status blocks after each bulletin is transmitted, and between ASCII TLM and WOD.

The mode-S beacon is ON, transmitting an unmodulated carrier, but telemetry indicates that it has partially failed, and delivering half power. This beacon is a useful test source for those testing mode-S converters, prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing. Any reports of reception on 2401 MHz. would be most welcome. Please e-mail g3cwv@amsat.org.

The 435.025 MHz. beacon is normally OFF. However it can sometimes be heard when the satellite is being commanded by ground control, ie. within range of Guildford, UK. When the 435 beacon is transmitting, the 145 beacon is normally OFF. The data transmitted is mainly binary.

OSCAR-11 users are welcome to visit my web site. It contains some software for capturing data, and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis, which is continually being expanded, as new data is captured. The URL is -

http://www.users.zetnet.co.uk/clivew/

37. Anyone have the Mod to TX in 430 Band for the IC-2710H????

Newsgroup: rec.radio.amateur.space
Date: 1998-01-05 00:00:00 UTC
From: Tim Havens <thavens@hps-inc.com>
Message-ID: <68rg8vshk1@usenet11.supernews.com>
Source record: 17259

I'm trying to work the SAFEX rptr. I have been able to open the RX of the IC-2710H
I have but the docs I have are NOT accurate on Diode placement on the main board,
so I am a bit nervous to do anything to them. If anyone has a valid mod they know works
to get TX in 430 band on this rig PLEASE email me.

thavens@hps-inc.com

38. More help with AO-27

Newsgroup: rec.radio.amateur.space
Date: 1998-01-05 00:00:00 UTC
From: Paul Garcia <prg22@ix.netcom.com>
Message-ID: <68rq4k$9u4@dfw-ixnews6.ix.netcom.com>
Source record: 17260

Well, I have my handheld quagi built for the 70cm downlink of AO-27 and I can successfully track the satellite and understand the transmissions. My question is, if I add a 2 or 3 element 2 meter beam on the same boom as the quagi, to use for the uplink, will the 2 meter and 70cm elements affect each other in any way? Thank You.

KF6MVO

39. NORAD Two-Line Orbital Element Sets (TLE120)

Newsgroup: rec.radio.amateur.space
Date: 1998-01-06 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <68s7ln$e6r$1@blackbird.afit.af.mil>
Source record: 17261

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial WWW:

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

40. Epsilon Bootes

Newsgroup: rec.radio.amateur.space
Date: 1998-01-06 00:00:00 UTC
From: "D.S.I." <savins@iol.ie>
Message-ID: <01bd1aa6$f6c2d960$LocalHost@iol.ie>
Source record: 17262
Cross-posted to: alt.alien.research,alt.alien.visitors,alt.alien.wanderers,alt.paranet.ufo,alt.ufo.reports,rec.radio.amateur.space

You may recognise the constellation named in the subject heading above. It is often quoted as the home of the "Greys" (aliens of X-Files fame, etc). Pop-astronomy-ufology though it may be, the source of this fantasy location is quite sound. The mention of Prof. R.N.Bracewell of Stanford in the "Universe" web-page prompted me to post this message. In Spaceflight, 1973, Duncan Lunan, President of the Association in Scotland for Technology and Research in Astronautics, published findings of his analysis of the work of previous radio-astronomers (Taylor and Young [USA], Prof. Carl Stormer [Oslo], Dr.Van der Pol at the Philips Research Institute [Eindhoven], J.B.Galle and G.Talon [France]) stretching back to 1927. It seems that radio-signals sent into space were being reflected (retransmitted) back to Earth at irregular intervals. Precise intervals.
In seconds: 8-11-15-8-13-3-8-8-8-12-15-13-8-8. And later:
15-9-4-8-13-8-12-10-9-5-8-7-6-12-14-12-8-12-5-8-12-8-14-14-15-12-7-5-5-13-8-

8-8-13-9-10-7-14-6-9-5-9-.
Lunan has interpreted these as astronomical charts, different enlargements of the constellation Epsilon Bootes. It appears to be a basic, logical numeric message which translates as: "Our home is Epsilon Bootes. It is a double star. We live on the sixth of seven planets, counted from the larger of the suns. Our sixth planet has one moon. Our fourth planet has three and our first and third planets have one each. Our satellite is in orbit around your moon." Seemingly, these messages are coming from an artificial satellite that has been revoving in our solar system for 13,000 years.
I get most of this from Von Daniken who naturally fits everything into his "Chariots" scenario. But, the most recent information I have is from 1976! Before the Hubble or the deep-space probes. What is the current situation? There is a strange dearth of information on this topic, even from the SETI Phoenix Project. I would have thought Dr.Richard Stauduhar (SETI signal detection expert) would have been onto this in a second (they are moving to Arrecibo in mid-1998, maybe then?). Was it all a hoax? Human error? If you have heard anything about this or are interested in more details please email me.

Regards,
David Irwin

The antenna is messed up. They are supposed to be fixing it on the next
spacewalk.....

42. Receiving Lunar Prospector

Newsgroup: rec.radio.amateur.space
Date: 1998-01-06 00:00:00 UTC
From: ke4zv@bellsouth.net
Message-ID: <34b27333.186821701@news.atl.bellsouth.net>
Source record: 17264

This is a bit premature since the Lunar Prospector hasn't been launched as of this note, but I'm wondering how many of you are interested in monitoring this satellite once it goes into orbit around the Moon?

According to the NASA FAQ, the downlink frequency is 2.273 GHz. That's near enough to our amateur S band that I expect most of us can tweak our converters to that frequency will little trouble.

Two things I haven't yet discovered are the downlink ERP and the modulation bandwidth that Lunar Prospector will be using. Those factors will determine how easy or difficult it will be to receive the signals. Certainly these signals will be much stronger than an EME echo, just how much stronger I don't yet know. Does anyone have any information about that?

The primary mission will last one year, and the satellite will orbit the Moon every 118 minutes, so there should be ample opportunities for us to listen in. Perhaps we won't be able to decode the telemetry, but just the fact of receiving the signal would be interesting.

Anyone else interested in this?

If Von Daniken is your primary source, I'd just caution you to consider
the source. And, I'm more than a little dubious that such a message
would be that easily decoded. I suspect that Lunan is reading more
into his sequences than he is reading *from* his sequences. This
isn't uncommon, and has happened many times with interpretations
of messages lacking a Rosetta stone to facilitate translation. It is
the million monkeys typing on a million keyboards syndrome. You
can find almost any pattern you like if you look in a certain way.

LDEs appear to be the result of unusual ionopheric ducts acting as storage rings. Most of the hard evidence for this comes from ELF measurements. LDEs at higher frequencies appear to be much rarer. That doesn't close the door on the idea that some LDEs might be something more than a natural phenomina, but it does raise the level of proof required to make that case.

44. Mir Repeater working... sometimes

Newsgroup: rec.radio.amateur.space
Date: 1998-01-06 00:00:00 UTC
From: The Marlin Family <marlins@ocracoke.net>
Message-ID: <34B2AC3A.2302@ocracoke.net>
Source record: 17266

yes the UHF repeater is up and working "somtimes" when the mir is
in normal condition. it's been on and off for about a week now i beleive.
possibly more. we have started seeing it pop up on the scan list again.
not quite regular yet though psbl some problems still and the mir power
system has given them quite a mess lately. heard a conversation from the
mir on the qso frequencies yesterday in Manteo NC about 2:pm, on a ht.
437.925 down 435.725 up pl 151.4 did not hear the repeater all day.
good luck, richard kf4gfj

Too bad a 2-meter repeater wasnt included in the package.

Has anybody tried measuring them from ABOVE? I considered putting ELF
equipment on a cheap suborbital flight, but if it's been done...

Even if they _are_ natural, one might be able to attenuate them.
Wasn't there a story recently about some wierd patent for weather
control using huge sparks that loop out past the atmosphere and back?

I made this point to the lady who designed what became the Clementine mission,
when she told me Motorola sold DSN radios off-the-shelf for $1,000,000. She
thought I was criticizing her!

I've heard two LDE's. One on 14 mhz from New Zealand, and one on 21 mhz
from Japan. It's pretty wierd! The Japanese LDE was monitored along the
entire West Coast, as I called some friends on the phone while I was
talking to the Ja station on CW. 3 second delay, and the ZL, on SSB, about
1 1/2 seconds. Dan WA7TDZ Oregon

Good grief, another moron. God must love morons because he
made so MANY of them.

There IS no constellation Epsilon Bootes. Epsilon Bootes is a
star. The constellation is Bootes.

Interested - very. Myself, possibly depending on scrounging together the
proper components and putting it all together. Here's some information
which NASA Ames provided to me -

Frequencies - 2273.000 MHz downlink 2093.0541 MHz uplink ï¿½
Omni antenna - 0 dB gain, RCPolarization
Medium Gain antenna - 6.5 dB gain, RCPolarization
Frequency: 2273.000 Mhz.
Power: 5 watts
Subcarrier frequency: 1.024 Mhz.
Modulation type: NRZ-L
Telemetry subcarrier modulation index: 1.3 rad
Data Rate: 3600 bps (300 bps initial turn-on and emergency)

Calculating the path loss, required performance in the receiving setup,
how to modify a Drake downverter, and the rest is left as an exercise for
the reader.

Hi,
I have an Icom 821 that I bought in the UK that is setup for the UK frequencies.

I was unable to locate the matrix with a quick look inside - it looks like they are somewhere on the circuit board that is mounted to the front panel.

Can anyone point me to where they are - I don't have a service manual.

Thanks,

John Melton, g0orx/n6lyt

Radio Meteor Observation Bulletin No. 53 January 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Barcelona, Spain (01 59' E, 41 21' N)
Frequency: 48.250 MHz
Transmitter location: most likely Czech television C2 C. Budejovica,
100 kW, horizontal polarisation.
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
Antenna: astronomical azimuth 215 deg (=NE), elevation 0 deg.
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (100 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT and
"Data Capture" software with 9 second/18 sampling interval to
store all the > 1.0 s signal increases.

| Dec 1997

Notes:
. ? probably affected by sporadic-E, direct reception
. ! Dec 13, 1h - 8h UT: test of new data sampling system
. Dec 11-13: 144 MHz test
. *observed* Geminid maximum on Dec 15, 4-5h UT

Enric Fraile Algeciras

--------------------------------------------------------------------------------
Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
```

66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 deg (= E),
elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

. Ursids activity on Dec 22-23

Maurice De Meyere

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Notes:
. faithful Geminids, with double observed peak on Dec 13-14
. local time = UT + 1 hour

Pierre De Groote

Observer : Kimio Maegawa JA9BOH
Transmitter : HAM beacon (JA6YBR) (50 W Morse coded, 50.017 MHz) by
Miyazaki-University Ham Club.
Antenna: 1 lambda crossed loop, Az Omnidirectional 20 m H
Location: Miyazaki city (131.43 E, 31.82 N) NE-SW path 650 km
Receiver : IC706mk2 with high stability quartz option.
Sensitivity: -150 dBm or lower, detect 3 dB galaxy noise variation
Antenna: 4 element Yagi (10 dBi) 2 m above the ground, 0 deg elev.
Location: Sugiyama Meteor Observatory, Japan (136.1E, 35.9N) 320 m ASL
Observing method:Automatic Duty Cycle measurement every minute by Audimate
software by Mr. Mallama of AMS above -130 dBm threshold.
[see RMOB9707 for an announcement about this software]

Notes:
. local time = JST = UT + 9 hours
. Geminids peak seemed to occur at around 15h UT on Dec 14.
The activity was very low before this peak based on my observation.
. But:
Observer: Yoshifumi Minagawa
Location: Sanjyo-city (138.80 E 37.38 N)
Antenna : 5 elem Yagi, zero elevation
Transmitter JA9YDB beacon at Sabae-city (136.18 E, 35.93 N) 50 W
CW 2 element Crossed Yagi antenna aiming to Zenith
showed a different result. Peak at his location was around 15h UT on
Dec 13. There were many echoes both on Dec 13 and 15.
. Duty Cycle Graph for the Geminids 1997 can be found at

Kimio Maegawa

Observer: Sadao Okamoto
Location: Damine Meteor Observatory, Japan (137.53 E, 35.07 N)
Transmitter: HAM beacon (JA9YDB) for RMO (50 W CW, 53.7500 MHz) by
JA9BOH Kimio Maegawa. No modulation except for identification.
Antenna: 2 element Cross Yagi 4 dBi aiming to Zenith. Omnidirectional
in azimuth and elevation above 15 deg elevation.
Location: Fukui-NCT at Sabae city (136.2 E, 35.9 N)
At present time about 10 observer are listing for
Kimio Maegawa's 53.75 MHz beacon.
Receiver: IC575 (-150 dBm)
Antenna: 2 element Yagi, pointed to the zenith
Observing method: FFTDSP software,automatic data saving and manual count.

Hourly echoes over 10 dB SNR

Chikara Shimoda

Observer: Ilkka Yrjola

Location: Finland (26 35' E, 60 54' N)
Frequency: 87.360 MHz
Receiver: Salora SRP-22 modified, narrow band FM (B=15 kHz).
detected signal level >-122 dBm.
FM detection, no pulse noise rejection required.
Antenna: 2 element Yagi with 4 dBd gain to SW, azimuth 45 deg (SW)
Data sampling system: threshold triggering, sampling rate 64 ms.
Computer logs total hourly elapsed reflection time, number of
threshold crossings for the hour, the longest time the signal was
continuously above detection level for the hour.
Data stored in the Compact MS-Soft format. Software for viewing available
from FTP.FUNET.FI pub/ham/vhf-work/mssoft43.zip (420 K).
I have completed the facelift upgrade with the Compact MS-Soft and you may
now download the V5.0 software package from my homepage www.sci.fi/~oh5iy

60. Home brew transceiver

Newsgroup: rec.radio.amateur.space
Date: 1998-01-07 00:00:00 UTC
From: Stephanie Moyer <bjmoyer@wcic.com>
Message-ID: <34B4160A.4117@wcic.com>
Source record: 17280

Is there any good articles or plans for home brew transceivers used for space communication? I have plans for the antennas but cant find any for the transceiver. I am new but I do know also that most sat. transmit on one freq and recive on another. So would i need to get two different transceivers so i could cover most of the satalites

Thank you for your advice

Jay Moyer

Hi.....

There is apparently an article on a 10M to 70cm transverter
in the "The VHF/UHF DX Book" edited by Ian White, G3SEK

I am looking for anyone who has built the 432 Mhz transverter
and could offer their comments good/bad/easy to build ????

Also if possible if someone is willing to photocopy the article for me
or scan it and email them to me in any popular graphic format.

It would be greatly appreciated.

Gidday there,

I am interested in getting into packet radio, and space based
message forwarding. I'm also interested in receiving information from
NOAAs tiros satellites.

What sort of semi-portable equipment would I have to get that
would allow me to do both things? (semi-portable = luggable = place in
backpack = powered by 12V)

Also, if there is an FAQ associated with this group, I'd
appreciate a pointer to it.

Thanks in advance

The delays were plotted on an x-y planes, making about a dozen increasingly
complex connect-the-dots diagrams. The first was the constellation bootes.
One of the early ones appeared to be a ram-scoop engine.

Source record: 17190

Well, I have my handheld quagi built for the 70cm downlink of AO-27 and I can successfully track the satellite and understand the transmissions. My question is, if I add a 2 or 3 element 2 meter beam on the same boom as the quagi, to use for the uplink, will the 2 meter and 70cm elements affect each other in any way? Thank You.

There are other folks here who know antennas much better than i do. But i think if you put the 2 meter beam behind the 70cm quagi, you'll probably do fine. If you send me the dimensions of both, i'll be happy to simulate them with NEC2 and make the results WWW accessible. You will, of course, either need a duplexer or two radios with separate feedlines.

If you can hear AO-27 well enough to reliably copy callsigns, then you'll do fine. It's got a very sensitive, wideband receiver, so you may not even need a beam for the uplink. But if you use an omni, be aware that a gain omni intended for terrestrial use won't work well on AO-27 except maybe for the low elevation passes.

We are looking for a suitable modem/TNC for our ground station.
I found the DSP-2232 will allow us to communicate with all modes
of amateur satellites. The problem is that the company that made
this dsp went out of business last year.
The question is how critical is the technical support for this
modem?
Did anyone use this modem? did you face any problems? will you
recommend us to use/not use this modem?

We are a group of students just starting our radio amateur satellite
experiments. Your input is highly appreciated.

Thank you.

There has been at least one attempt to do this which failed. There
may have been others.

>> That doesn't close the door on the idea that some LDEs might be
>> something more than a natural phenomina
>
>Even if they _are_ natural, one might be able to attenuate them.
>Wasn't there a story recently about some wierd patent for weather
>control using huge sparks that loop out past the atmosphere and back?

I think you may be confusing some different things. NASA has
photographic evidence of the existence of natural discharges of
that sort. That's recently been on the news, but there's no evidence
it affects weather. Rather, it appears to be an effect *of* weather.
And there is some speculation about weather modification by artificial
heating of the upper atmosphere, see some of the ravings about Project
HAARP. We won't know if there's anything to that until we try it.

The issuance of a patent doesn't mean the process actually works.
There are a lot of nonsense patents granted, so having a patent doesn't
necessarily give a process much credibility. A patent is just a registration
of a claim about how one thinks a process works. If you turn out to be
first and right, it can mean some money. If you don't, oh well.

Do you have dates and times? It would be interesting to see the state of the ionosphere at the time. Was the LDE really heard all up and down the West coast, or just parts of it? That would be useful information too. Where the signal exits the duct is of interest.

Thanks for the info, Philip. One way path loss at 2.3 GHz is about -206 db,
and we're starting with +43.5 dbm, so signal strength at the receive antenna
will be about -162.5 dbm. Noise power in the signal bandwidth will be about
-148 dbm. So we need an antenna gain of about 14.5 dbi to reach MDS.
We can easily do much better than that, so it should be feasible.

Many are available, and you can find them at many web sites.

Two handy sites are:

www.acs.oakland.edu/oak/
and
www.amsat.org

You'll need to browse a bit to find the right sub-pages for satellites,
but you may find other good stuff along the way.

Hi Bill,

I'm new to sattelite operation and have been using PC-Track (Version 3)... I found it on AOL and it's shareware. There are many out there, but for me, I feel very comfortable with it... Has many features.... I like that you can import the kep data and the various graphic features. Runs in DOS. Hope this helped!!

82. Discone Antenna and Sats

Newsgroup: rec.radio.amateur.space
Date: 1998-01-10 00:00:00 UTC
From: n2icz@aol.com
Message-ID: <19980110152000.KAA24902@ladder01.news.aol.com>
Source record: 17204

Hi.

I've been using a simple ground plane to transmit to the RS sattelites with pretty good success. A friend of mine suggested using a vhf/uhf discone antenna because it's omni-directional and has no gain. Plus, it has the capability of transmitting on 440 and above. So , I could have multiband capacity in the future and possibly work FO-20 with it...(although I may be stretching it) My argument is that the discone still has a low angle of radiation and will only be as effective as the ground plane. Has anyone had any experience with a discone and the RS series or other sattelites that operate in modes A and JA? Ideally, I'd like to get one of those M2 Eggbeaters... But for now, I'd like to experiment a bit. Any thoughts? I'm trying to figure out a way to hit the satellites on the low angle passes and avoid fading signals once they reach the higher angles. Simple, though...I can't really put up a beam...Thanks.

73,

Larry-N2ICZ

=========
SpaceNews
=========

MONDAY JANUARY 12, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* SPUTNIK-40/RS-17 NEWS *
========================
Officals report that after operating for 55 days, the Sputnik-40/RS-17
satellite has gone silent. Sputnik-40/RS-17 was launched by Russian
Cosmonauts from the Space Station Mir on 04-Nov-97, and transmitted
a low-power VHF-FM beacon signal on 145.820 MHz. The satellite was
built by students, and launched to help celebrate the 40th anniversary
of the launch of the original Sputnik satellite, and the dawn of the
space age. Sputnik-40/RS-17 continued to operate under lithium battery
power until 29-Dec-97, almost four weeks longer than designers had
anticipated.

* RS-12 NEWS *
==============
Pat, G3IOR, has reported through Ray, W2RS, that the RS-12 satellite has
been placed in Mode KA (2-meters + 15-meters up, 10-meters down). As a
result of this change, look for increased activity on RS-12, particularly
among groundstations without VHF radio equipment.

G3IOR also reported that RS-12's ROBOT 15-meter uplink suffers from an
unexplained deep signal fade that has a period of about four seconds.
This phenomenon is seen only on through the ROBOT, and not when operating
through the analog transponder.

* STS-89 NEWS *
===============
Ken Ernandes has uploaded STS-89 nominal orbital data to the AMSAT-NA Web
site. This data represents the initial planned orbit for STS-89 based on
a planned launch time of: 23-Jan-98 at 02:48:16 UTC

The AMSAT Web site data will be updated to reflect any changes to the
planned orbit including those due to changes in the launch time. As always,

this data will also be maintained during the mission with data reflecting
the actual orbit of the STS-89 spacecraft and the Shuttle/Mir complex.
The AMSAT Web site Shuttle Orbital Data is at:

http://www.amsat.org/amsat/sarex/orbit.html

The alternate Web site for Shuttle orbital data is:

http://www.mindspring.com/~n2wwd

The STS-89 nominal two-line Keplerian elements are:

STS-89
1 99989U 98023.14663194 .00037821 59761-8 88592-4 0 17
2 99989 51.6623 59.5301 0017156 330.4488 219.0071 15.95897611 15

Note that "99989" is a temporary catalog number. A permanent catalog
number and international designator will be assigned after STS-89 has
actually been launched.

Also, since the Space Shuttle will be launched into a high inclination
orbit during nighttime hours, persons living along the east coast of the
US may have a chance to see the glow of the Shuttle's engines prior to main
engine cutoff (MECO) as it travels in a northerly direction, up the coast.

* MIR NEWS *
============
The following graph by Jean-Claude, FB1RCI depicts the orbital altitude
of the Mir space station based on the Mean Motion of the spacecraft.
An increase in Mean Motion corresponds to a decrease in mean orbital
altitude. The slow decay in altitude is probably the result of
atmospheric drag.

Scientists tell us that the moon is receding (because of "tidal
effects") at a rate of about 4cm/year. This suggests that in a million
years or so there will be no total eclipses of the sun as the moon will
no longer appear large enough to obscure it fully.

> I know it's kind of a silly question, but from a fiction standpoint,
> I'm intrigued.

It's not a silly question, and if you don't mind being referred to
another writer of fiction, read "The End of the World News" by Anthony
Burgess. He even includes some interesting "tidal effects" :-)

RS-17 DECLARED DEAD

HR AMSAT NEWS SERVICE BULLETIN 011.01 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 11, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-011.01

It's official. The Sputnik PS2/RS-17 mini-satellite ceased transmitting on December 29, 1997. The little satellite, a one-third scale replica of the original Sputnik 1, beep-beeped its way around the globe for 55 days, more than two weeks longer than it had been projected to last. The 100-mW transmitter was powered by lithium batteries.

The Sputnik PS-2 was launched by hand from the Russian Mir space station on November 4, 1997, to commemorate the 40th anniversary of the launching of the original Sputnik by the USSR in 1957. The original Sputnik only transmitted for about one month.

The Sputnik PS2 beacon, on 145.82, was widely monitored and recorded around the world. The satellite was fabricated by students in Russian and on France's Reunion Island. Sputnik 40 Years, which sponsored the satellite project, said the last known recordings of the Sputnik PS2 beacon were made on December 29 at approximately 2100 UTC by a ham in Washington and by FR1AJ on Reunion Island. At the time, the data indicated an internal temperature of 40 degrees Celsius.

Those tracking the satellite reported that the Sputnik PS2's beacon signal had continued to get weaker as the end approached. Even after the beep-beep ceased, however, the satellite's unmodulated oscillator continued to transmit for a while longer.

Reception reports go to The Radio Club of Jules Reydellet school on Reunion Island. Those whose reports are confirmed will receive an approximately 6x9-inch color certificate on high-quality paper with number identification and the radio club stamp. Requests for these certificates should be made only by letter with an SASE (6x9 inch) and two (2) IRCs. Do not send requests via e-mail. The mailing address is FR5KJ Radio Club, 103 Rue de la Republique, 97 489 Saint Denis Cedex, Reunion Island.

[ANS thanks the ARRL for the news report.]

SB SAT @ AMSAT $ANS-011.02
MIR's LIFE EXTENDED

HR AMSAT NEWS SERVICE BULLETIN 011.02 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 11, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-011.02

The 12-year-old Russian Mir space station may stay in orbit until the first components of the International Space Station are in place in 1999. That's a few months longer than Mir was supposed to stay up. The first ISS units are set to be launched later this year. Hams are scheduled to be among the first crew members to populate the ISS, but the US presence aboard Mir comes to an end this June.

Us astronaut David Wolf, KC5VPF, now aboard Mir, is scheduled to be replaced later this month by Australian-born US astronaut Andy Thomas, KD5CHF. Two new Russian crew members, both hams, are due to arrive at month's end. The Russian cosmonauts are Talgat Musabayev, RO3FT, and Nikolai Budarin, RV3FB. Wolf has been on Mir since late September. Thomas will work aboard Mir until June.

Wolf's research schedule has allowed him little spare time to use the ham radio equipment aboard Mir. The packet system aboard the space station has been experiencing problems because the crew has not had time to set up the correct parameters for the new TNC aboard Mir. This week, Wolf, 41, monitored and filmed operations from inside MIR's main module as his two cosmonaut crewmates conducted a space walk to check a leaky hatch and to retrieve some equipment. On January 14, Wolf and cosmonaut Anatoly Solovyov will do a spacewalk to recover some experiments.

[ANS thanks the ARRL for this information.]

SB SAT @ AMSAT $ANS-011.03
STS-89 ORBITAL DATA

HR AMSAT NEWS SERVICE BULLETIN 011.03 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 11, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-011.03

Ken Ernandes, N2WWD, has uploaded
STS-89 nominal orbital data to the AMSAT Web site. This data represents the initial planned orbit for STS-89 based on the following planned launch time:

23-JAN-98 / 02:48:16 UTC

The AMSAT Web site data will be updated to reflect any changes to the planned orbit including those due to changes in the launch time. As always, this data will also be maintained during the mission with data reflecting the actual orbit of the STS-89 spacecraft and the Shuttle/Mir complex. The AMSAT Web site Shuttle Orbital Data is at:

http://www.amsat.org/amsat/sarex/orbit.html

The alternate Web site for Shuttle orbital data is:

http://www.mindspring.com/~n2wwd

The STS-89 nominal two-line Keplerian elements are:

STS-89
1 99989U 98023.14663194 .00037821 59761-8 88592-4 0 17
2 99989 51.6623 59.5301 0017156 330.4488 219.0071 15.95897611 15

Note that "99989" is a temporary catalog number. A permanent catalog number and international designator will be assigned when STS-89 has launched.

[ANS thanks Ken Ernandes, N2WWD, for this report.]

FOLLOW-UP TO HOUSTON NET

HR AMSAT NEWS SERVICE BULLETIN 011.04 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 11, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-011.04

Well if it was missed, the 200th Houston AMSAT Net was one to listen to. One hour of the best information that can be found. The Net contained important up to the minute information about P3D and other projects.

The evening had interviews with Bill Tynan, W3XO, AMSAT President talking about P3D and the future of satellites.
Frank Bauer, KA3HDO, AMSAT Vice President of Manned Space Flight talked about the Lunar Prospector from Goddard Mission Control and also about ham radio equipment aboard the International Space Station
Lou McFadin, W5DID, AMSAT P3D Lab Manager spoke about the construction of the satellite. Stan Wood, WA4NFY, AMSAT Board of Directors member and Vice President for Engineering, as well as a member of the team in Orlando, talked about tests of the antennas and other phases of construction of the satellite. Finally, Keith Baker, KB1SF, AMSAT Executive Vice President talking about launch possibilities of P3D.

A Real Audio copy of the interview and net can be listened to by connecting to the Houston AMSAT Net web site and clicking on the "200th Net". The web site address is http://www.amsatnet.com

[ANS thanks Bruce KK5DO, Net Producer, AMSAT Area Coordinator, for this info.]

SB SAT @ AMSAT $ANS-011.06
WEEKLY SATELLITE REPORT PT 1

HR AMSAT NEWS SERVICE BULLETIN 011.06 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 11, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-011.06

MIR
American astronaut David Wolf, KC5VPF, will be replaced by Andy Thomas,
KD5CHF, During the January STS-89 Mission. The PMS 2-meter radio station was
temporarily moved from the core module and installed in the Priroda Module.
This move was performed to take advantage of the backup antenna.
The crew also installed a new modem a few weeks ago. But due to the crews
heavy work load, all of the TNC parameters have not been properly
configured. Mirex would like the stations monitoring the PMS to please
be patient while they make adjustments. The PMS is NOT fully operational at
this time.

During the recent space walk, the crew was planning on examining the
primary PMS antenna located on the Mir-core module, If time permits.
The crew suspects there may be a loose coax cable to the primary
PMS antenna. If the antenna checks out fine, the crew will still leave the
PMS station connected to the backup antenna until the March time frame.
This is because the crew will be very busy with many other experiments and
will not have much time for a low priority experiment such as the PMS.

The only limitation they have with the current backup antenna, is the
Diplexor filter which is required for the SAFEX and PMS to share the same
antenna. This would prevent any 70 cm experimentation from the Kenwood
TM-733.
[ANS thanks the MIREX team for this information]

SAFEX, MIR 70 cm Repeater (Uplink 435.750 MHz FM, Downlink 437.950 MHz FM, subaudible tone 141.3 Hz)
During last weeks momentary Mir attitude control computer shut-down. The Mir crew temporarily shutdown the Amateur Radio station for a few days. The PMS system was turned back on, but it is not known when the crew plans on turning on the SAFEX Repeater.

MIREX has created an Internet Web page containing information regarding Mir and the various Amateur Radio experiments taking place from the space station. The pages are still "under construction", but some good information can be gathered from what has been put together. URLs include the following:

http://www.ik1sld.org/mirex.htm OR
http://www.ik1sld.org/mirex

http://www.geocities.com/~ik1sld/mirex.htm OR

[ANS thanks the MIREX team for this information]

AO-10
(Uplink 435.030-435.18 MHz CW/LSB, Downlink 145.975-145.825 MHz
CW/USB)
Operational.

AO-27
(Uplink 145.85 MHz FM, Downlink 436.792 MHz FM)
Operational
[ANS thanks Michael Wyrick, N4USI, AO-27 Control-op, for this update]

FO-20
(Uplink 145.9-146.0 MHz CW/LSB, Downlink 435.8-435.9 MHz CW/USB)
Operational. FO-20 in mode JA continuously.
FO-20, like many Leo's is in a "sun synchronous" orbit. The precession in the RAAN of its orbit due to the earth's oblateness matches the earth's rotation around the sun so that FO-20 always has about 33 minutes of eclipse time each orbit and the rest in sunshine. A sun synchronous orbit is a retrograde LEO polar orbit with an inclination of about 98 degrees. At this inclination RAAN precession = 360 degrees in 365 days. The stability in temperature and solar energy is, needless to say, very helpful. The ratio of eclipse to sunlight can be adjusted by varying initial orbital elements. FO-29, for example, is virtually always in sunlight, UO-11 has about 22 minutes of eclipse, most seem to run about 33 minutes eclipse per orbit.

This also means that FO-20 (and other sun synchronous sats) appear at your location at about the same "sun time" every day. At my QTH FO-20 goes over about 1:30 PM and 3:30 PM every day. UO-11, AO-16, DO-17, WO-18, LO-19, UO-22, KO-25, AO-27, FO-29 etc are also in sun synchronous orbits. KO-23, RS-12/13, RS-15, though in highly inclined orbits, are not sun synchronous.
[ANS thanks Stacey Mills, W4SM, and Kazu Sakamoto, JJ1WTK, for this report]

SB SAT @ AMSAT $ANS-011.07
WEEKLY SATELLITE REPORT PT 2

HR AMSAT NEWS SERVICE BULLETIN 011.07 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 11, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-011.07

KO-23
(Uplink 145.85, 145.9 MHz FM, Downlink 435.175 MHz FM,
9600 Baud FSK)
KO-23 operating normally.
[ANS thanks Jim Weisenberger, AA7KC, for this report]

KO-25
(Uplink 145.980 MHz FM, Downlink 436.5 MHz FM, 9600 Baud FSK.)
KO-25 operating normally.
[ANS thanks Jim Weisenberger, AA7KC, for this report]

OSCAR-11
(Downlink 145.825 MHz. FM, 1200 Baud PSK. Beacon 2401.500 MHz)
Operating normally.
The operating schedule is unchanged.

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

There are also additional status blocks after each bulletin is
transmitted, and between ASCII TLM and WOD.

The mode-S beacon is ON, transmitting an unmodulated carrier, but
telemetry indicates that it has partially failed, and delivering half
power. This beacon is a useful test source for those testing mode-S
converters, prior to the launch of P3-D. It is considerably weaker
than DOVE, which should be used for initial testing. Any reports of
reception on 2401 MHz. would be most welcome. Please e-mail
g3cwv@amsat.org.

The 435.025 MHz. beacon is normally OFF. However it can sometimes be
heard when the satellite is being commanded by ground control, ie.
within range of Guildford, UK. When the 435 beacon is transmitting,

the 145 beacon is normally OFF. The data transmitted is mainly
binary.

OSCAR-11 users are welcome to visit my web site. It contains some
software for capturing data, and decoding ASCII telemetry and WOD.
There is an archive of raw data (mainly WOD) for analysis, which is
continually being expanded, as new data is captured. The URL is -

93. Re: Help DSP-2232

Newsgroup: rec.radio.amateur.space
Date: 1998-01-12 00:00:00 UTC
From: Dietrich Morgenstern <76050.1341@compuserve.com>
Message-ID: <34B9589C.33B4@compuserve.com>
Source record: 17215

I have used the DSP2232 for the last two years for satellite work with good results. As far as I can see this seems to be the only unit with a broad coverage of the present amateur birds. All other units support only selected birds (if at all).
With the buyout by timewave the support should be available. Also new firmware releases seem to be in the works.
I noticed advertising by TIMEWAVE showing new lower prices. That means that they have started selling this unit.

Hope this helps

My theory for LDE's is that a dense, parabolic shaped region is formed in space. This area is located at a significant distance from earth. Radio signals from earth travel to this area, are collected and redirected to the focal point. If the earth happens to be within this focal point, an echo results. The dense region may be formed by gravity waves or other phenomenon resulting in an area of great density.

> I am looking for anyone who has built the 432 Mhz transverter
> and could offer their comments good/bad/easy to build ????

I've not built it, but I have looked very carefully at this section of Ian's book, while trawling for ideas for developing a high dynamic range front-end for use in repeaters located on troublesome sites. It looks well worth building if you are interested. There are signs that the design was done pretty thoroughly, and I would expect it to be quite dependable. There are also the no-tune designs from the USA, look for Zack Lau's stuff in ARRL publications and kits from Down East Microwave for other designs.

> Also if possible if someone is willing to photocopy the article for me
> or scan it and email them to me in any popular graphic format.
> It would be greatly appreciated.

It's a very good book. If you intend building something of this extent, the accompanying reference material by the same group of people might prove to be helpful. I don't know about book availability from VK stockists, but this one is worth waiting for by snail-mail. Besides, Ian reads this group and is a pretty decent fellow ($5). I think he'd be reasonable about photocopying if there was no alternative, but with a current book and many outlets (compatible with any popular credit card format) this is not really the case, so if I offered to photocopy the thing, I might find terrible things about me being revealed in a column in Radcom......

If the book really is difficult to obtain, then I may be able to help get one to you.

Cheers

96. AO-27 antenna polarization

Newsgroup: rec.radio.amateur.space
Date: 1998-01-12 00:00:00 UTC
From: David Drumheller <drumheller@nrl.navy.mil>
Message-ID: <34BA4081.41C6@nrl.navy.mil>
Source record: 17218

--

I've been receiving 436.795 mHz. downlink signals from the AO-27
satellite using a homemade yagi antenna, but I'm now interested in
working the 2 meter uplink, too.

Question: What is the polarization of the downlink with respect to the
uplink? That is, if the downlink (at my sight) is vertically polarized,
should I expect the uplink to be vertically polarized, too?

Dave, KA3QBQ

The internet certainly does not have ALL satellite photos. The
low Earth orbit sats transmit continuously and do so over areas
that have no simple internet access ...

98. NORAD Two-Line Orbital Element Sets (TLE124)

Newsgroup: rec.radio.amateur.space
Date: 1998-01-13 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <69ei65$f1l$1@blackbird.afit.af.mil>
Source record: 17220

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial WWW:

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

99. Re: Help DSP-2232

Newsgroup: rec.radio.amateur.space
Date: 1998-01-13 00:00:00 UTC
From: Jeff Griffin <kb2wqm@amsat.org>
Message-ID: <34BB9CC1.7DD3AD7B@amsat.org>
Source record: 17221

I bought a used DSP-2232 a few months ago, for a real good price. I find it usable on all modes. I also own a PacCom NB-96 modem set and find the PSK modem in the NB-96 is more sensitive then the S/W PSK modem in the 2232. Timewave support should be good if you purchase new. For ease of use I would recommend the DSP-2232. If you need any help setting up send me an email.

I need the dimensions for a 3 element, 2 meter yagi (145.85 Mhz). I am going to use 1/8" welding rod and a wooden boom. I would prefer the boom length to be around 32". Thank you.

>
I knew you would ask that. Sorry, closest I can remember is about 1972
for the Ja on 21 mhz, and about two years later for the ZL on 14 mhz.
Noted it in my log books at the time, but packed away.
yes, the Ja was heard along the West coast. A friend of mine was in a
group discussion on 75 meters with friends ranging from BC to Los Angeles,
and after I
called him, he announced it to his group, and most, if not all, listened
to it on 15 meters and relayed back on 75 that they were hearing it as
well, with the usual "weird" etc.....
I was operating from Eugene, Oregon (CN84) at the time. I tried to
tell the JA station many times what was going on, but unfortunetely
language difficulties prevented his understanding. I do recall that I did
get a QSL, but with out mention of any unusual nature of MY sig.
Also recall that it was early evening, but can't recall what season
it was. 1972 was downward slide of the then current solar cycle wasn't it?
Sorry I can't relate more about this one, but still remember it.
Also, the ZL heard was quite late at night, also heard from Eugene,
Oregon. Since I now operate almost exclusively weak sig vhf now, don't
listen to HF much anymore. Good luck with your LDEE research, Dan
O'Connell WA7TDZ Oregon

103. Want plans for a 2m/440 duplexer

106. Current weather satellite frequencies

Newsgroup: rec.radio.amateur.space
Date: 1998-01-14 00:00:00 UTC
From: lawrenceh@peverell.demon.co.uk
Message-ID: <34c3f29c.28492737@news.demon.co.uk>
Source record: 17227

For those interested in the weather satellites (wxsats) the following
are operational:

Polar orbiters:
NOAA-12 picture data on 137.50MHz and beacon on 136.77MHz.
h.r.p.t. on 1698.0 MHz

NOAA-14 picture data on 137.62MHz and beacon on 137.77MHz.
h.r.p.t. on 1707.0 MHz

Meteor 3-5 picture data in sunlight only on 137.85MHz.

Geostationary:
reception depends on longitude:
WEFAX transmissions on 1691.0MHz
Meteosat-6 (also WEFAX on 1694.5MHz) at zero longitude.
Goes-8 75 degrees long.
Goes-9 135 degrees long.
GOMS at 76 degrees long.
GMS at 139 degrees long.
Fengyun-2 at 104 degrees long.

109. Which Satellite Capable Radio?

Newsgroup: rec.radio.amateur.space
Date: 1998-01-14 00:00:00 UTC
From: diehard2@pop.phnx.uswest.net
Message-ID: <34BD6670.4242CFEF@pop.phnx.uswest.net>
Source record: 17230

This is definitely a newbie question - but I don't see a FAQ anywhere.
:-(

I'm just starting to seriously look at Amateur Satellite communications.
Picked up a copy of "Nova for Windows" tracking program (
http://www.nlsa.com) - great program. So I'm getting enthused!

Before investing in a satellite capable rig, I'd like to get input from
people that have been doing this awhile. What are some of the Pros and
Cons of the various radios? I doubt whether there is a perfect radio,
but why don't you post what you like and dislike about the radio(s)
you've tried.

Icom IC-821H

Kenwood TS-790A

Yaesu FT-736R

Yaesu FT-846 (not out yet - and I don't need the HF)

others?

Thanks for any input,
Bill K7UOP

Hi there ..

maybe what you need is a mode-j desense filter .. such as the one
which is shown on www.amsat.org homepage.

> I need some plans for a 2m/440 duplexer to use on my AO-27 setup. Can
> somebody post this information or would this be too difficult to build?

I have built one litrally from scrap. (eg old copper pipes..)
Had it checked for 2m rejection on a professional
hp networkanalyser.
The -3dB Bandwide on 435MHz was 11MHz and insertion loss 0.2 dB !!
Rejection on 145MHz was -68dB !!

Just drop me a mail for further details ..

Hello Ian.
If you have a sound card for your computer, there is a freeware software program that does an excellent job at receiving pictures from the wx satellites. You can find it at the following FTP site:
ftp://ftp.funet.fi/pub/ham
Then get into the fax/sstv directory. Look for a program called wx230.exe I've been using it here and am very impressed with the software. If you don't have a soundcard, check out the jvfax program in the same FAX/SSTV directory. There are diagrams to build up a couple of circuits for wx sat reception. Hope this helps out.

Thanks there, I already have jvfax and a hamcomm i/face, what I was
actually asking (excuse my lack of detail in last post) was what was
the easiest way in which to actually recieve the signals on the
ar8000/is the width of the ar800 (band) wide enough for wx decoding
from the sats etc etc etc,
Sorry about that i should have included more detail !

thanks a lot anyway

I have a FT-726r & FT-736r and I like them both. Are you intereted in analog or digital. If you just want to talk, get a FT-726r for starters and enjoy the birds. I was amazed by the fact that Burghardt Amateur Center has 12 used FT-726's on hand! A few are set up for Satellite if you're interested.

Mark - N0NSV
(No, I'm not associated with Burghardts! Just a happy customer)

Its a real shame if he gets to go, after he made such a fool of
himself during the Senate hearings into the President and VPs illegal
campaign raising activities (in the White House).

It looks like Clinton is trying to pay off Sen. Glen for his attempts
in the Senate to derail the Clinton/Gore fundraising scandel
investigation in the Thompson Committee.

I doubt NASA would agree to let Glen ride on the shuttle if not
pressed by the White House.

On May 5, 2000 all nine (9) planets of our solar system will come into a direct alignment. There are many predictions of planet destruction associated with this gravitational pulling.

My question is, has this happened before? If so, when and what if anything happened when it did?

This happened on Jan.16,1998 and earth was destroyed.
Think about it.

They can laugh at my primary AO-27 antenna (a homebrew 2M quarterwave),
but Steve's recommendation of the Yaesu FT-5100 FM transceiver got me
onto AO-27 without a pre-amp(!). His QTH is not exactly the best for
the sats, so if it works well for him, i think you should consider it
seriously.

How direct is direct?

My question is, has this happened before? If so, when and what if
anything happened when it did?

Yeah, about 15 years ago, when I was in grade school, they all came into
a 95 degree arc, or something like that.

Fb. I'm not familiar with the particular scanner you are using, but for best results, I think a bandwidth of abt 35 khz or more is recommended. I'm using a modified systcoms radio here. Also, if you are using the hamcomm board with jvfax, you will have to build up that second circuit shown in the jvfax diagrams directory. It is the simple circuit using the 2206 chip. This goes in line ahead of the hamcomm board. The docs for this circuit are in german, but it's not too difficult to figure it out. Good luck with your scanner. Hope it works out for you!

Hi all,

I wonder if somebody can give me some idea how to get better pics from NOAA14 and METEOR3-5.I receive pics but very poor definition.

Working conditions :

Receiver: IC-R100

Antennas:Icom AH7000,Homebrew 137Mhz Quadrifilar helical,V-U GP....all tried in turn

I have tried the receiver on all modes of it(FM,WFM,AM)...works better on FM.

All ideas will be welcomed.

Hi Mike!

This weekend is the VHF contest! Tune around 144.200 (actually anywhere from 144.150 to about 144.300) - if you are running horizontal polarization with a decent antenna you should hear stations in the contest. If you have a horizontal yagi or other directional antenna, point it toward a population center during the contest, which starts at 1900 UTC on Saturday and runs until 0400 UTC Monday.

If you are using a vertical cut for the FM portion of the band, that may be the reason you have not heard anyone.

Good luck and 73,

I'm probably going to go with the Yaesu FT-847. I'm currently
using an ICOM IC-730 HF XCVR to work RS-12 in Mode K (15M up,
10M down) and an Alinco DJ-580 handheld 2m/70cm XCVR to work
AO-27 (2M up, 70cm down, FM). I've only made a couple of RS-12
contacts, which isn't surprising considering that I have to
work half-duplex and manually flip the bandswitch and A/B VFO
setting between transmit and receive. The crossband full-duplex
on the FT-847 should eliminate that problem, as well as letting me
try 6M and 2M tropo and meteor scatter work and my normal rations
of HF DXing and contesting.

Friends who have FT-726's tell me that they're outstanding.
Apparantly, however, finding band modules other than 2m and 70cm
is quite difficult.

I'm sorry for not making myself more clearer.. hehe.. I should have wrote that I got a 2 meter all mode radio, and yes I know I need a horozontally polarized antenna for SSB, but before I bought one I wanted to make sure there was still decent activity on it in my area... Thanks for the massive messages, most of them telling me I needed a horozontally polarized antenna hehe.. Guess you learn how to post better by the School of Hard Knocks! Any idea's on making one or the one that is the 'best buy' for the money?

73's, and hope the 2m SSB contest goes well this weekend.

I have the opportunity to obtain two high quality 8.5 db Yagi 430Mhz
antennas very inexpensively. How will these work if cross polarized
compared to circular off -the- shelf products?
Thanks
Don
KC7SEA

Sorry, I assumed SCO were your initials. Anyway, why not get on 145.55
and discuss it with John when he gets up there again?

For the sake of completeness:

homebrew

Whether you go the transverter route or create complete radios
is your choice; both approaches have pros and ocns.

An interesting idea. I assume the density of which you speak is electron density, presumably trapped from the solar wind. I'm a bit puzzled as to the mechanism which would create this parabolic shape, however. You mention gravity waves, I assume you are using that term in its hydrodynamic sense because the other usage would be nonsense in this case. But the bow shock actually has a hyperbolic shape instead of a parabolic shape. The distance from Earth is also wrong for the observed delay intervals. Perhaps you are suggesting that this reflection zone forms in the magnetotail instead. Is there any observational evidence to support this hypothesis?

>Is there any observational evidence to support this hypothesis?

None; I have no idea what mechanism could form such a region, however
the reported duration of the delays implies a propagation distance far
in excess of what one would expect from ducting around the earth. If
this were the case, the entry and exit points would have to be dynamic
in order to store the wave for many trips around the earth.

FWIW, the video/movie "The Jupiter Menace" dealt with this
situation.....But it was a warning for the 1982 alignment!!!!!!!It was
full of dire predictions of destruction by psychics etc. But it appears
we survived. There is nothing to fear to be sure. Do a run yourself on
astro sofware looking for conjunctions. You'll see it occurs around
every 22 or so years.
Adrian.

It makes great copy in the "Weekly World News" and sells a few
paperbacks...

> My question is, has this happened before? If so, when and what if
> anything happened when it did?

It's happened many, many times before. No disasters have befallen Earth or any other planet as a result. The gravitational attraction of all the planets combined is but a tiny fraction of what we get from the moon (and the sun) every day. No alignment of the planets would make more or less of a difference than the moon moving a few more miles along its orbit.

Any radio that will cover the needed band. I have made AO-27 contacts using just a Yaesu FT-470. I have made other contacts using a Yaesu FT-480 (2 meter all mode, 10 Watts , 20 years old) and a Collins 75-A3 on the down link. The best thing to do is asess what you have and make a few contacts with your existing equipment to see if it is your cup of tea before parting with the $$$.

The all in one VHF/UHF/SHF boxes are nice, but far from needed to complete many enjoyable satellite contacts.

My opinion only,
Joe

I don't know the specifications for this receiver. You must have a bandwidth (IF) of at least 35 kHz. 40 kHz is best. Much more leaves you open to interference.

In my opinion it is a very good book (although it says that TBA120S is good for meteorscatter converter, I believe it is not). The book shows many very good ideas you will never find elsewhere. But I also like to have several other books....like RSGB VHF-UHF manual anno 1976, DUBUS handbooks (the first in the series is best), The dutch VHF/UHF Handboek, UHF Unterlage and many more

The most important point - but unfortunately often not understood by the authors - for any handbook is to provide and distribute printed circuit boards for projects discussed.

A mediocre circuit will almost always be chosen provided a pcb is available. G4DDK designs ufb circuits and PCBs, but are pcbs readily available?
I once tried the RSGB multi oscillator "UHF source" (every stage oscillated), I started to build two units, and they were a complete disaster - primarily because of nonexisting impedance matching from each transistors to the tuned circuits.

For Sale
Icom 820H 2M(45W)/440(35W) Serial Number 01238 Purchased new in March of 1996 , VG-EX condition

Used primarily for space and terrestrial digital communications.
Great rig, the 9600bd performance is unmatched, according to QST.

Out of band TX/RX (I'm a MARS op) and satellite 9600bd modifications (both factory authorized and described) done.

Package includes:
- Comet CF-416 Duplexer - splits 2M/440 signal from a single feed line and dual band antenna.
- Icom AG-35 440 Preamp (never outside) - powered from IC820 via coax.

Asking $1050 FIRM + Shipping for the package.
(Prefer Atlanta area exchange)

Date: 1998-01-19 00:00:00 UTC
From: afn54413@afn.org
Message-ID: <6a0dbo$6d1$1@maya.ece.ufl.edu>
Source record: 17083

Would someone please explain why if my scanner receives a satellite's
beacon frequency it can't receive that satellites beacon signal?

Thanks

Lee

What would the people recommend as a starter rigs for use with sats. It must be as cheap as possible. I have't used any yet and would like to sample them.. Thanks.

You can get a Yaesu FT726-R (used) from Burghardt's for around $850 with
the sat unit and 430 and 144 modules....

There could be lots of reasons why your scanner can't receive a satellite beacon. Like path to the satellite, mode, receiver sensitivity, and with the case of Amateur Radio satellites, the satellite may not be in you receive view (satellite footprint).

Your question is very broad, and suggests you need to learn more about electronics and radios before you try receiving satellites.

Cal.

In my opinion it is a very good book (although it says that TBA120S is good for meteorscatter converter, I believe it is not). The book shows many very good ideas you will never find elsewhere. But I also like to have several other books....like RSGB VHF-UHF manual anno 1976, DUBUS handbooks (the first in the series is best), The dutch VHF/UHF Handboek, UHF Unterlage and many more

The most important point - but unfortunately often not understood by the authors - for any handbook is to provide and distribute printed circuit boards for projects discussed.

A mediocre circuit will almost always be chosen provided a pcb is available. G4DDK designs ufb circuits and PCBs, but are pcbs readily available?
I once tried the RSGB multi oscillator "UHF source" (every stage oscillated), I started to build two units, and they were a complete disaster - primarily because of nonexisting impedance matching from each transistors to the tuned circuits.

NO GIMMIC. PLEASE READ!

DO YOU WANT TO MAKE MONEY FAST?

Of course you do, we all do!

Here's how to do so with little effort, and, yes IT'S LEGAL.

A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00!
So I thought, "Yeah, right, this must be a scam!" but like most of us, I was curious. Like most of us, I kept reading. Anyway, it said that if you send $1.00 to each of the 6 names and addresses stated in the article, you could make thousands in a very short period of time. You then place your own name and address at the bottom of the list at #6, and post the article to at least 200 newsgroups. (There are about 22,000.) or e-mail them to friends, or e-mailing lists...

No catch, that was it.

Even though the investment was a measly $6, I had three questions that needed to be answered before I could get involved in this sort of thing.

1. IS THIS REALLY LEGAL?

I called a lawyer first. The lawyer was a little skeptical that I would actually make any money but he said it WAS LEGAL if I wanted to try it. I told him it sounded a lot like a chain letter but the details of the system (SEE BELOW) actually made it a legitimate legal business.

2. Would the Post Office be ok with this...?

I called them: 1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL!
(See Title 18,h sections 1302 NS 1341 of Postal Lottery Laws). This clarifies the program of collecting names and addresses for a mailing list.

3. Is this moral?

Well, everyone who sends me a buck has a good chance of getting A LOT of money ... a much better chance than buying a lottery ticket!

So, having these questions answered, I invested EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps ... and boy am I glad I did! Within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just continued coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had a mad total of $1,000.00! In the third week I had over $10,000.00 and it was still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in.....

It's certainly worth $6.00 and 6 stamps!

So now I'm reposting this so I can make even more money! The *ONLY* thing stopping *ANYONE* from enriching their own bank account is pure laziness! It took me all of 5 MINUTES to print this out, follow the directions, and begin posting to newsgroups. It took me a mere 45 minutes to post to over 200 newsgroups. And for this GRAND TOTAL investment of $ 7.92 (US) and under ONE HOUR of my time, I have reaped an incredible amount of money -- like nothing I've ever even heard of anywhere before!

'Nuff said!

Let me tell you how this works, and most importantly, why it works. Also, make sure you print a copy of this article now, so you can get the information off of it when you need it. The process is very simple and consists of THREE easy steps.

==========
HOW IT WORKS
==========

STEP 1:

Get 6 separate pieces of paper and write the following on each piece of paper:

PLEASE ADD ME TO YOUR MAILING LIST.
$1 US DOLLAR PROCESSING FEE IS ENCLOSED.

(THIS IS KEY AS THIS IS WHAT MAKES IT LEGAL SINCE YOU ARE PAYING FOR AND LATER OFFERING A SERVICE).

Now get 6 $1.00 bills and place ONE inside EACH of the 6 pieces of paper so
the bill will not be seen through the envelope to prevent theft/robbery. Then, place one paper in each of the 6 envelopes and seal them. You should
now have 6 sealed envelopes, each with a piece of paper stating the above
phrase and an U.S. $1.00 bill.

Mail the 6 envelopes to the following addresses:

#1 - G. Rice
P.O. Box 572
Humboldt, AZ 86329
#2 - Michelle Owensby
3019 Elliot Street
Baltimore, MD 21224
#3 - Ralph Kabota
625 Whitney Ranch Dr. #1613
Henderson, NV 89014

#4 - Ron "Magneto" Foster
10010 Menlo Avenue
Silver Spring, MD 20910

#5 -JM McFall
451 Wellington Dr
San Carlos, Ca. 94070

#6 - Patrick Stevens
4802 forest DR.
Loris, SC 29569
STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number
6 on the list. (If you want to remain anonymous put a nickname, but the address MUST be correct. It, of course, MUST contain your country, state/district/area, zip code, etc! You wouldn't want your money to fly away, would you?).

STEP 3: Now post your amended article to at least 200 newsgroups. Remember
that 200 postings are just a guideline. The more you post, the more money
you make!

Don't know HOW to post in the news groups? Well do exactly the following:

HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:

The fastest way to post a newsletter: Highlight and COPY
(Ctrl-C) the text of this posted message and PASTE (Ctrl-V) it into a
plain
text editor (as Wordpad) and save it. After you have made the necessary
changes that are stated above, simply COPY (Ctrl-C) and PASTE (Ctrl-V)
the
text into the message composition window, after selecting a newsgroup,
and
post it! (Or you can attach the file, without writing anything to the
message window.)

If you have Netscape Navigator 3.0 do the following:

1. Click on any newsgroup like normal, then click on 'TO NEWS'. This
will
bring up a box to type a message in.

2. Leave the newsgroup box like it is, change the subject box to
something
flashy, something to catch the eye, as "$$$ NEED CASH $$$? READ HERE! $!
$!
$" Or "$$$! MAKE FAST CASH, YOU CAN'T LOSE! $$$". Or you can use my
subject
title.

3. Now click on 'ATTACHMENTS'. Then click on 'ATTACH FILE'. Find your
file
on your Hard Disk (the one you saved from the text editor). Once you
find
it, click on it and then click 'OPEN' and 'OK'. You should now see your
file name in the attachments box.

4. Now click on 'SEND'/'POST'. You see? Now you just have 199 to go!
(Don't
worry, it's easy and quick once you get used to it.) NOTE: All the
versions
of Netscape Navigator's are similar to each other, so you'll have no
problem to do this if you don't have Netscape Navigator 3.0.

! QUICK TIP!

(For Netscape Navigator 3.x and above)

You can post this message to many newsgroups at a time, by simply
selecting
a newsgroup near the top of the screen, hold down the SHIFT, and then
select a newsgroup near the bottom of the screen. All of the newsgroups
in/between will be selected. After that, you follow/do the basic steps,
stated below at this letter, except for step #1. You can go to the page

stated below in this letter and click on a newsgroup to open up the newsgroups window. Once you've done this, in the same window go to 'OPTIONS', and then mark 'SHOW ALL NEWSGROUPS' and 'SHOW ALL MESSAGES'. Now
you can see all the newsgroups and you can apply easier the above tip.

If you have MS Internet Explorer do the following:

1. Go to the newsgroups and press 'POST AN ARTICLE'. To the new window type
your headline in the subject area and then click in the large window below.
There either PASTE your letter (which it's been copied from the text editor), or attach the file which contains it.

2. Then click on 'SEND' or 'OK'. NOTE: All versions of MS Internet Explorer
are similar to each other, so you won't have any problem doing this.

GENERAL NOTES ON POSTING: A nice page where you'll find all the newsgroups
if you want help is http://www.liszt.com/ (When you go to the home page, click on the link 'Newsgroup Directory'). But I don't think you'll have any
problem posting because it's very easy once you've
found the newsgroups. All these web browsers are similar. It doesn't matter
which one you have. (But it makes it very easy if you have Netscape Navigator 3.0 or later. You may download it from the Internet if you don't
have it.) You just have to remember the basic steps, stated below.

BASIC STEPS FOR POSTING:

1. Find a newsgroup and you click on it.

2. You click on 'POST AN/NEW ARTICLE' or 'TO NEWS' or anything else similar
to these.

3. You type your flashy headline in the subject box.

4. Now, either you attach the file containing your amended letter, or you
PASTE the letter. (You have to COPY it from the text editor, of course, from before.)

5. Finally, you click on 'SEND' or 'POST' or 'OK', whatever is there.

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of
mail you receive. If you wish to stay anonymous, you can invent a name to
use, as long as the postman will deliver it.

**JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. **

ANOTHER EXCELLENT PROGRAM: "AutoPoster" http://www.spck.se/bulk/

MULTIPLE. POSTING ON HUNDEREDS OF NEWSGROUPS AT ONCE . The worlds most effective AutoPoster to Internets newsgroups!

A high speed Newsgroup Auto Poster/Newsreader for Windows 95
Autopost articles to more than 27,000 newsgroups
Super fast - up to 12,000 posting per hour on a single PC
Easy to run

Built in Special Functions such as:
Scramble Random Fake Sender
Rotate Unlimited Postings
Group Postings
Force Hits

==========
Now the WHY part:
==========

Out of 200 postings; say I receive only 5 replies (a very low example). So
then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my
name at #5 and only 5 persons respond to each of
the original 5, that is another $25.00 for me, now those 25 each make 200
MINIMUM posts with my name at #4 and only 5 replies each, I will bring in
an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies
each, I will make an additional $626.00! OK, now here is the fun part, each
of those 625 persons post a MINIMUM 200 letters with my name at #2 and they
each only receive 5 replies, that just made me $3,125.00! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1

and if still 5 persons per 200 newsgroups react I will receive
$15,625,00!
With an original investment of only $6.00! AMAZING! And as I said 5
responses is actually VERY LOW! Average are probable 20 to 30! So lets
put
those figures at just 15 responses per person. Here is
what you will make:

at #6 $15.00

at #5 $225.00

at #4 $3,375.00

at #3 $50,625.00

at #2 $759,375.00

at #1 $11,390,625.00

When your name is no longer on the list, you just take the latest
posting
in the newsgroups, and send out another $6.00 to names on the list,
putting
your name at number 6 again. And start posting again. The thing to
remember
is, do you realize that thousands of people all over the world are
joining
the internet and reading these articles everyday, JUST LIKE YOU are now!
So
can you afford $6.00 and see if it really works? I think so... People
have
said, "what if the plan is played out and no one sends you the money? So
what! What are the chances of that happening when there are tons of new
honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, every day, with thousands of those joining
the
actual Internet. Remember, play FAIRLY and HONESTLY and this will work.
You
just have to be honest.

By the way, if you try to deceive people by posting the messages with
your
name in the list and not sending the money to the rest of the people
already on the list, you will NOT get as much. Someone I talked to knew
someone who did that and he only made about $150.00, and that's after
seven
or eight weeks! Then he sent the 6 $1.00 bills, people added him to
their
lists, and in 4-5 weeks he had over $10k. This is the fairest and most
honest way I have ever seen to share the wealth of the world without
costing anything but our time! You also may want to buy mailing and

e-mail
lists for future dollars. Make sure you print this article out RIGHT
NOW,
also. Try to keep a list of everyone that sends you money and always
keep
an eye on the newsgroups to make sure everyone is playing fairly.
Remember
that HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea
to
make the money!

GOOD LUCK to all and please play fairly and reap the huge rewards from
this, which is tons of extra CASH. Please remember to declare your extra
income. Thanks once again...

==========

LEGAL? ? ? (Comments from Bob Novak who started this new version.)

"People have asked me if this is really legal. Well, it is! You are
using
the Internet to advertise your business. What is that business? You are
assembling a mailing list of people who are interested in home based
computer and online business and methods of generating income at home.
Remember that people send you a small fee to be added to your mailing
list.
It is legal. What will you do with your list of thousands of names?

Compile all of them into a database and sell them as "Mailing Lists"
on the internet in a similar manner, if you wish, and make more money.
How do you think you get all the junk mail that you do? Credit card
companies, mail order, Utilities, anyone you deal with through the mail
can sell your name and address on a mailing list, unless you ask them
not to, in addition to there regular business, So, why not do the same
with the list you collect. You can find more info about "Mailing Lists"
on the internet using any search engine.

.." So, build your mailing list, keep good accounts, declare the
income and pay your taxes. By doing this you prove your business
intentions. Keep an eye on the newsgroups and when the cash has stopped
coming (that means your name is no longer on the list), you just take
the
latest posting at the newsgroups, send another $6.00 to the names stated
on
the list, make your corrections (put your name at #6) and start posting
again.

==========

NOTES:

*1. In some countries, the export of the country's exchange is illegal.
But

you can get the license to do this from the post office, explaining the above statements (that you have an online business,
etc. You may have to pay an extra tax, but that's OK, the amount of the incoming money is HUGE! And as I said, a few countries have that restriction.

*2. You may want to buy mailing and e-mail lists for future dollars. (Or Database or Spreadsheet software.)

*3. If you're really not sure or still think this can't be for real, please
print a copy of this article and pass it along to someone who really needs
the money, and see what happens.

*4. You will start getting responses within 1-2 weeks, it depends.

* SOUTH POLE ON OSCAR *
======================
Late last year, Ronald Ross, KE6JAB, traveled to Antarctica with a portable
Pacsat station, and used his radio equipment to share his experiences with
friends via the UoSAT-OSCAR-22 amateur radio communication satellite.

Ron and his wife Sheryl departed from San Francisco, California, and arrived
in Punta Arenas, Chile on December 21, 1997. From Punta Arenas, they traveled
to Patriot Hills, Antarctica on Christmas Day 1997 on a Hercules transport
plane operated by South African Airways.

Ron's portable pacsat station station consisted of an Icom IC-821 transceiver,
a 70-cm low-noise receive preamplifier, a pair of eggbeater antennas mounted
on seven foot bamboo poles 20 feet apart on either side of Ron's tent, a
Kantronics KPC9612 packet radio terminal node controller, a laptop computer,
and a 12 volt 18 amp/hr storage battery that was recharged using a solar panel
borrowed from a Cessna pilot.

During his stay in Antartica, Ron was able to relay not only text messages
to friends via UoSAT-OSCAR-22, but color images (JPEGs) well. A total of
70 messages were upload to the satellite, 16 of which were JPEG images.

Since UoSAT-OSCAR-22 is in a high inclination polar orbit, and Ron was
situated very close to the south pole (80S, 81W), he was in an ideal location
to enjoy satellite access every 100 minutes, 24 hours a day. Ron also tried
accessing other pacsat satellites, but had his best luck with UO-22.

Ron reported that his portable pacsat station generated a lot of interest
amongst other people at the basecamp. Many were amazed by the ability of
an amateur network to provide such communications on a voluntary basis,
especially considering the official communications at the camp were
hampered due to problems experienced with Inmarsat.

Ron and Sheryl departed from Antarctica and arrived back in Chile on January 12, 1998 after a very successful expedition. OSCAR satellites clearly proved their value in keeping Ron in touch with the rest of the world using a minimum of radio equipment. Reports and images relayed by Ron during his stay in Antarctica may be found on the Web at:

http://www.thistle.org/

Several days prior to Ron and Sheryl's departure from Anarctica, Andre Phillips (ex VP8MAP) arrived at the south pole and was waiting for his portable pacsat communications equipment to arrive at press time. Like Ron, Andre expects to share his experience with others through the UoSAT-OSCAR-22 and KITSAT-OSCAR-25 pacsat communication satellites.

* OSCAR-11 NEWS *
==========
During the period between 16-Dec-97 and 14-Jan-98, the UoSAT-OSCAR-11 satellite has continued to provide good signals on its 145.826 MHz beacon, although occasional interference has been caused by DOVE-OSCAR-17 which transmits on 145.825 MHz.

Interest in the Mode-S beacon continues as stations prepare for P3D. Four reports have been received. Stacey Mills, W4SM, reported receiving S3 to S4 signals compared to an S2 noise level. At the same time, DOVE was S8. Stacey uses a two foot diameter G3RUH dish with 2.5 turn helix and an SSB downconverter. Manfred, XE1ZBO, in Mexico City has received strong signals from UO-11 using a Conifer partial dish and SSB converter. Mark, KE7NS, reports receiving good signals above an S7 noise level. He uses a 21 element beam, Aircom pre-amp, and Drake downconverter.

UoSAT-OSCAR-11 spacecraft telemetry has been nominal. Internal temperatures have continued to fall, and at the present time are 6.4C and 4.2C for battery and telemetry electronics respectively. This fall in temperature is due to increasing solar eclipse times, which are expected to reach a maximum in early February.

Two WOD surveys have been transmitted during the reporting period. Both are of channels 10, 20, 30, 40 (+Y, -X, +X array currents, array voltage), and are dated 14-Dec97 and 06-Jan-98 respectively. They show the effect of solar eclipses on array currents and voltage.

The newly formatted AMSAT-UK bulletin number 114 is now being transmitted by UoSAT-OSCAR-11. This report contains details of amateur satellite frequencies and modes of operation. It is intended to be a "fixed" message that won't become out of date too quickly. It may, however, be changed from time to time, possibly at monthly or greater intervals. Regular listeners will note that the new bulletin makes a different sound compared to previous bulletins, rather like a new form of binary data. This is because the bulletin contains regularly placed blocks of spaces, instead of random text characters.

The operating schedule is unchanged.

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

There are also additional status blocks after each bulletin is transmitted, and between ASCII TLM and WOD.

The Mode-S beacon is ON, transmitting an unmodulated carrier, but telemetry indicates that it has partially failed and is delivering only half power. This beacon is a useful test source for those testing Mode-S converters prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing. Any reports of reception on 2401 MHz would be most welcome. Please e-mail reports to: g3cwv@amsat.org.

The 435.025 MHz beacon is normally OFF. However, it can sometimes be heard when the satellite is being commanded by ground control (ie. within range of Guildford, UK). When the 435 MHz beacon is transmitting, the 145 MHz beacon is normally OFF. The data transmitted is mainly binary.

OSCAR-11 users are welcome to visit an OSCAR-11 web site created by Clive Wallis, G3CWV. It contains some software for capturing data and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis which is continually being expanded as new data is captured. The URL is:

http://www.users.zetnet.co.uk/clivew/

[Info via Clive Wallis, G3CWV (g3cwv@amsat.org)]

* SKN NOMINATIONS DUE *
==========
Ray Soifer, W2RS, reminds us that it's time to send in nominations for "Best Fist" in this year's Straight Key Night (SKN) on OSCAR. Please address nominations via e-mail to: w2rs@amsat.org, via packet radio to: W2RS @ WA2SNA.NJ.USA.NA or to W2RS @ GB7HSN.#32.GBR.EU, or via snail-mail to Ray's callbook address. The list of winners will be be made known in early February.

[Info via the AMSAT News Service]

168. Re: Which Satellite Capable Radio?

Newsgroup: rec.radio.amateur.space
Date: 1998-01-20 00:00:00 UTC
From: Bill Clay <RRLM01@email.sps.mot.com>
Message-ID: <34C50F95.A7ACBFBA@email.sps.mot.com>
Source record: 17090

Could you mention what features you like about the 970?

I've seen the Icom IC-970H mentioned, but haven't been able to find any descriptions of it at all. It would be nice to see all the specs, but it would be pretty hard to get it into electronic format.

Thanks,
Bill - K7UOP

I have the Kenwood 790 and it WORKS for me! If you want to use most of
the sats, you're gona need an all-mode rig. That's the only way to go!
Plus, when the bands open, ssb and cw will get you more contacts than fm
will.

Get on the local repeaters and harrass the people a little about not
getting on ssb!! Start a weekly net and get the word out. Might work for
you. It works for us here in SE Mi especially on 6 meters. Also, make
sure you've got a horizontal antenna and think about getting an amp. 150
watts ought to get you started.

James,

I just picked up a used Icom IC-211 2m all mode for around $300 and together with my Grundig YB400 shortwave radio, I have been very successful in working RS-12 in mode A (2m up/10m down). I built a simple turnstile antenna tuned to 10m for receive and I'm using my existing vertical antenna for the 2m uplink. You also need a computer with some tracking software.

It's much easier than I thought it would be. In 2 weeks I've already been able to work about 6 states inlcuding Montana, Illinois, Florida and North Carolina; all from Long Island, New York.

Bottom line: you don't have to spend a ton of money to get started. Go cheap to see if you like it. I'm hooked! Good luck and have fun.

73,
John, KB2YJH

Hi Mike,

I understand your situation. I have observed the same situation. I am in
Pacolet, (Spartanburg County), SC I will be glad to work you on 2mtr SSB.

173. NORAD Two-Line Orbital Element Sets (TLE130)

Newsgroup: rec.radio.amateur.space
Date: 1998-01-22 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <6a646qsdt1@blackbird.afit.af.mil>
Source record: 17095

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial WWW:

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

The electron densities of the ionosphere *are* dynamic and vary from
location to location (consider sporadic E clouds for example). This same
sort of "lumpiness" may also occur from time to time in the F layers.

However, it appears I might have been prematurely skeptical of your
suggestion. I did a bit of research and located a paper which seems
to support your hypothesis.

Lawton, A. T., "Long Delayed Echoes--The Trojan Ionosphere",
Journal BIS, Vol 27, December, 1974.

Dr. Lawton has been able to receive LDEs with some predictability
and puts forward the idea that they are the result of a plasma confined
in the Moon's trailing Lagrange point (one of the so-called Trojan points
which exist due to the interplay of the Earth-Moon system). He has
recorded a number of echoes which point to this conclusion with delays
of from 2.5 to 10.2 seconds. His historical research of LDEs show that
they occur most often when this region is above the horizon of the
transmitting and receiving stations, that they are most likely to be heard
at a solar minimum, and that the months of February and March are the
most likely months to observe them. (So we might want to keep our
ears open over the next couple of months.)

The reason for the variability of the delays is due to different plasma
densities in the Lagrangian point at the time of the LDE, and hence
a varying speed of sound. Apparently (he theorizes) the plasma behaves
somewhat like a maser with accoustic coupling. The varying delay is a
function of the current speed of sound in the plasma and the plasma's
current shape/extent. (This is a plausible mechanism, and laser-like

behavior has been observed in the upper atmosphere of Mars, so
such natural amplifiers do exist.)

If Dr. Lawton is correct, and a number of others support his ideas (including Lunan, who abandoned his ET repeater theory), this lays to rest the origin of many of the LDEs which have been observed. But the idea that they are signals trapped in the plasma of the more ordinary ionosphere still has currency among some researchers, and there is evidence for that which has been obtained at ELF (I've heard ELF signals delayed by several seconds myself, and they showed the characteristic pitch shifting associated with ionospheric trapping). Perhaps there is more than one way for LDEs to occur.

I don't know a great deal about balloons, however, I have read about them here on the Net. Basically, your NUMBER 1 concern is the temperature which is going to be experienced at high altitude. You need to insulate the electronics from the -40 or -60 degree temperature extremes. As far as impact is concerned, you just need to design a really good parachute! A really simple setup is as follows:
You have a payload. The payload is attached to some strings which, in turn, are attached to a parachute. The parachute vent (at the top) is connected to a ring. The ring is connected to the harness going over the balloon. The balloon goes up.
When it reaches altitude, the outside pressure has gone down, and the balloon is BIG. In fact, if it were seven feet wide on the ground it would be almost 30 feet wide at 100,000 feet altitude. At that stage, the balloon can no longer support the expansion. It pops, and the payload shoots back to earth. When there is enough air for the parachute to be effective, it opens and slows the descending payload to a terminal velocity of (<hopefully>) no more than 11 miles per hour. Want more info? Go to www.amsat.org. Scroll down until you reach a hypertext link entitled "High-altitude Balloons." Click on it. From there, about half-way down, you will be able to obtain about fifteen or so links to balloon projects around the world. Go to the NTBP page. They have 33 35mm photos up to 95,000 feet!
Good luck,
Joshua Rozovsky

177. Need to Know frequencies of 2meter repeaters in Tampa Bay area the rebroadcast Shuttle Missions

Newsgroup: rec.radio.amateur.space
Date: 1998-01-22 00:00:00 UTC
From: "Michael Holland Sr." <contour96@sprintmail.com>
Message-ID: <6a96fi$t1m$1@newsfep2.sprintmail.com>
Source record: 17099

I moved from the Orlando-Winter Garden area and was able to receive and enjoy listening to the rebroadcasts of the NASA TV audio on my 2M FM rig on 146.940 (Titusville, Florida) but since moving to the Tampa Bay area, I've not been able to find a frequency or repeater that does the same so I've had to resort to this here computer via Real Player 5.0 or my General coverage receiver DX-390 and Realistic DX-160 Short-wave receivers to the Goddard Amateur radio station in Greenbelt, MD.
Can anyone assist me?
Also wish to find out who the volunteer examiners would be for the Tampa bay, Florida area too so I can test to obtain my Tech-No Code "ticket"
I was and have in my possession a Novice ticket I acquired in New Jersey in 1981 but has long since expired. So I can only listen to the HTX-202 I have but wish to join the ranks...
if you are wondering as to why all the Radio shack products listed in this posting; I work for Radio Shack (TM) at Brandon Town Center Mall in Brandon, Florida but got the DX-160 when I was 17 years old.

178. Satellite Telemetry - How?

Source record: 17100

For a student project, I'm wondering what would be involved in setting up radio telemetry and communications with high-altitude craft (like balloons), with such features as GPS, barometric pressures, temperatures, ATV, etc. Money is of no concern at the moment, so any suggestions are welcome. I would also like to know if anyone on this list can offer any guidance for the following scenario:
A high-altitude balloon is designed to tear at a certain height, then drop back to the ground. However, it would be desirable to have the instrument package saved. How would one put together a circuit that would take a barometric pressure reading, and release the instrument package, which would then (how?) have a parachute open for its safe return to the ground.
Can anyone offer any suggestions? Even if you think you have any ideas whatsoever, or if you are an expert in the field, go ahead and e-mail me. My knowledge in this are is about nil, so any input is appreciated. Please reply through private e-mail (ab7lp@qsl.net).

Thanks in advance,

This is just an idea, but it might bear looking into:

Old style satellite TV hardware is being replaced with the newer 18" dishes
all over the country. I picked up an 8' spun aluminum dish for US$100 with
the alt/az mount attached. minor modification of the mount and replacement
of the LND would result, in my mind, in a *super* satellite antenna if you
added active tracking.

181. Handheld GPS Units & Grid Squares

Newsgroup: rec.radio.amateur.space
Date: 1998-01-23 00:00:00 UTC
From: Mark Fossum <n0nsv@amsat.org>
Message-ID: <34C97702.9E0E1C83@amsat.org>
Source record: 17103

I've been considering the purchase of a Handheld GPS unit for my "other hobby" (fishing) and thought I might combine its' use with workin' satellites.

Here's my question: Anyone know if these GPS units convert Lon/Lat to Gridsquares? Which brand? Which Model?

Someone (can't remember who) told me that certain units DID convert lon/lat to gridsquares but I've never found a unit that does.

Let me know...
Thanks!
Mark Fossum - N0NSV

Josh:

For the 435 MHz downlink I would recommend a Mirage (KLM) 18C, 18 element (9 ele in each plane) circularly polarized antenna or equivalent. BTW I just retired a pair of them and put up a pair of Mirage (KLM) - 40CX, 40 element circularly polarized antennas. The only disadvantage of the higher gain antennas is that the beamwidth is much narrower, so you have to touch up the antenna pointing much more often. One of the few disadvantages of higher antenna gain! Be sure to get an antenna with the ability to switch between RHC (right hand circular) and LHC. It is amazing the difference that it makes on some occasions. BTW I use a pair of Mirage (KLM) -14C antennas for the uplink on FO-20/29. Work great, but only one would really be needed. My antenna system is really for AO10 and AO-13 (R.I.P.- sigh!!). You won't need stacked antennas to do a good job on FO-20/29. Just singles would be fine.

John N5JB.

The Garmin GPS III does it. CQ-VHF February issue tells all about it.

189. NOAA satellites

Newsgroup: rec.radio.amateur.space
Date: 1998-01-24 00:00:00 UTC
From: Robert Daniel <PAGERMAN@worldnet.att.net>
Message-ID: <6adpfm$ms8@bgtnsc03.worldnet.att.net>
Source record: 17111

I am new to satellite reception and have some elementry
questions about NOAA.
1. Are some NOAA satellites not transmitting anytime?

2. Some that I have received dont seem to be transmitting
on every pass. Are they on one pass and off the next?

3. How often should kep elements be updated in tracking software.

4. I have heard there is a beacon signal in addition to the fax
signal. What kind of modulation is on this beacon?

Thanks and 73s
Robert Daniel WA5EWS

> 1. Are some NOAA satellites not transmitting anytime?

I don't know all the satellites. As for the low-Earth-orbit
weather satellites:

The Russian Meteor 3-5 satellite (currrently turned on) actually
transmits only when it is in daylight. It shuts itself off when
in the dark. Meteor 2-21 is currently turned off, but ground
control may turn it back on and may turn Meteor 3-5 off (see (2)).

Some others, like SICH-1 and OKEAN 1-7, are turned on and off
under ground control. Generally, they are turned on only when
they are over Europe or Asia.

> 2. Some that I have received dont seem to be transmitting
> on every pass. Are they on one pass and off the next?

Meteor 3-5 is slowly drifting westward. Soon, it will be in the
dark most of the time. Then ground control may turn it off and
activate 2-21. Meanwhile, because of the drift, it may seem to
be on for one pass (if you catch the beginning of one) and off
during the next (if you happen to tune in late, after it has
switched off).

Also, I've read reports of people occasionally catching SICH-1
when it was still turned on over the U.S., but that seems to be
a rare event (maybe ground control missed turning it off on one
pass?).

> 3. How often should kep elements be updated in tracking software.

I do it about once a month for the NOAA and Meteor satellites.
That's plenty often if you're using an omnidirectional antenna
for receiving. If you're using high-gain, narrow-beam antennas,
you'll have to do it more often.

>
> 4. I have heard there is a beacon signal in addition to the fax

Don't need it; don't use it.

I believe it says in the Satellite Experimenter's Handbook TO ALSO adjust the transmit frequency. I have the 2nd edition of that book. But, YES you do need to also change the transmit frequency. Good Luck,
Joshua Rozovsky, N3YAR

192. Re: Handheld GPS Units & Grid Squares

Newsgroup: rec.radio.amateur.space
Date: 1998-01-24 00:00:00 UTC
From: Mark Fossum <n0nsv@amsat.org>
Message-ID: <34CABE9E.564FE1F8@amsat.org>
Source record: 17114

Everything points to the Garmin line of GPS units. Looking at the Web Page for Garmin, they list the "Maidenhead Grid System" that most of the Grid chasers use. Looks like the others (Lowrance, Eagle) don't include the Maidenhead system in their GPS's.

I looked through my ARRL World Grid Locator Atlas after I wrote this message and found a short program written in Basic that converts Lat/Lon to the Maidenhead grid. Too bad that a few of the others didn't include it since it's such a simple program.

Thanks for help everyone!

Mark

Dear Robert:

As far as I know NOAA-12 and NOAA-14 transmit continuously.
However, Meteor 3/5, a Russian satellite transmitting in the same format as
the NOAA satellites, goes off the air if the area it is photographing is in
darkness. As for updating satellite elements, I've heard of many people
who do it only once a month. I think you could do it bimonthly without
problem. As for the beacon signal, I don't know anything about that.
There is a mailing list for keplerian elements for many of the ham
satellites, and there is a weather satellite mailing list as well. If you
want to know how to subscribe, drop me a line.

Dear All:

I just tried to work a pass of FO-29 and came away frustrated. I
almost worked three different people (two on cw and one on SSB) and
couldn't seem to complete the QSO's. It might have been that we are using
different conventions for doppler compensation. THE SATELLITE EX-
PERIMENTER'S HANDBOOK suggests leaving the transmitter frequency fixed,
while adjusting the receiver frequency to compensate for doppler. See,
p. 10-3. However, I got the impression that most of the stations on the
pass may have been compensating by tuning the transmit frequency.
Is there a switch from the HANDBOOK? It has been a while since I've
operated Mode JA.
Thanks and 73's de Bernie KF0QS

SB SAT @ AMSAT $ANS-025.01
MEETING HELD WITH ESA

HR AMSAT NEWS SERVICE BULLETIN 025.01 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 25, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-025.01

On January 20, Phase 3D Project Leader and AMSAT-DL President, Dr. Karl Meinzer DJ4ZC met with ESA officials in Paris to discuss the possible launch of the Phase 3D satellite on the third test flight of the Ariane 5 launch vehicle, AR-503.

Dr Meinzer gave a short presentation on AMSAT, its background and the history of cooperation it has enjoyed with ARIANE for many years. He then outlined the development history of Phase 3D and expressed a strong desire for a launch on AR-503.

The ESA officials indicated willingness to consider a launch on AR-503, but made no commitments. They stated that they are also investigating the possibility of placing another payload on the mission that would preclude launching Phase 3D. Nevertheless, ESA did agree to
to make an initial study of the configuration that would be associated with Phase 3D, were it to be launched on AR-503 along with several other payloads. They also agreed to investigate other possible launch opportunities, including ARIANE 4s.

Another meeting is scheduled for the end of February, at which time it is hoped that more definite information will be available..

Dr. Meinzer said on returning to Marburg following the 20 January meeting, "ESA is making bona-fide efforts to identify a launch for us. I think we stand a good chance."

Dr. Meinzer and AMSAT-NA officials agreed that our job now is to get Phase 3D completed and tested, so that it will be ready to go if ESA gives the "green light". AMSAT-NA Executive Vice President, Keith Baker KB1SF likened this to going to the airport to "stand by" in order to get on a fully booked flight. "That strategy often pays off", he added.

[ANS thanks Dr. Karl Meinzer DJ4ZC for the material that went into the preparation of this bulletin.]

SB SAT @ AMSAT $ANS-025.04
PORTABLE ANTARCTICA STATION A SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 025.04 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 25, 1998
TO ALL RADIO AMATEURS BT

BID: $ANS-025.04

Ronald Ross, KE6JAB, reports his recent trip to Antarctica with a portable digital satellite station was a huge success. The station, located at 80 degrees south and 81 degrees west, consisted of VHF and UHF eggbeater style antennas, an Icom IC-821H transceiver, a Kantronics KPC-9612 TNC and a laptop computer. Powered by a sealed lead acid battery, the station featured a solar panel recharging system.

KE6JAB transmitted over 70 messages of which 16 were JPEG images, using (initially) UO-22 and (then) KO-25. The messages and images were posted on Ron's website, which received over 700 hits during the operating period.

Ron said the portable satellite station generated a lot of interest among the non-amateur people at the base camp, indicating many were amazed at the ability of an amateur "network" to provide such communications on a voluntary basis, especially when the official communications at the camp experienced problems with the commercial satellite links. "I think Amsat and the amateur satellite community has great resources both in technical knowledge and operating skills," Ron said.

KE6JAB reports three people contributed greatly to the success of the portable station; Roy Welch, W0SL and Jerry Smyth, N8ULU, downloaded the satellite messages, and Ed Anderson, KE6IZN updated the website. Ron also would like to thank the many hams that answered his technical questions months ago when he first thought about taking a portable station on his trip.

Images of the KE6JAB trip can be viewed at Ron's website using the following URL address;

http://www.thistle.org

SB SAT @ AMSAT $ANS-025.05
UHF SHUTTLE FREQUENCIES

HR AMSAT NEWS SERVICE BULLETIN 025.05 FROM AMSAT HQ
SILVER SPRING, MD, JANUARY 25, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-025.05

Ron Parise, WA4SIR, informs the Amsat News Service that the following UHF frequencies are available on the shuttle transceiver.
296.8 - Used during launch/landing, and EVA 3-way duplex ops
279.0 - Used during EVA for 3-way full duplex comm between suit-1, suit-2, and the orbiter.
259.7 - Launch/landing, EVA 3-way duplex ops
243.0 - Standard UHF emergency freq.

The mode is AM as is standard in the aircraft band.

However, the launch comm is now changing. In the past the orbiter
communicated on UHF through Bermuda during ascent. The new plan is
to roll the orbiter to heads-up very early in the ascent to get the
upper s-band hemi's pointed up and communicate
with MCC through TDRS on s-band. WA4SIR, doesn't know whether the
transition to s-band results in the UHF transmitter
being turned off or they just keep transmitting on both. It's easy enough
to do either.

[ANS thanks Ron Parise, WA4SIR, for this information]

TO ALL RADIO AMATEURS BT
BID: $ANS-025.06

MIR
American astronaut David Wolf, KC5VPF, will be replaced by Andy Thomas,
KD5CHF, During the January STS-89 Mission. The PMS 2-meter radio station
Was temporarily moved from the core module and installed in the Priroda
Module. This move was performed to take advantage of the backup antenna.
The crew also installed a new modem a few weeks ago. But due to the crews
heavy work load, all of the TNC parameters have not been properly
configured. Mirex would like the stations monitoring the PMS to please
be patient while they make adjustments. The PMS is NOT fully operational
at this time.

During the recent space walk, the crew was planning on examining the
primary PMS antenna located on the Mir-core module, If time permits.
The crew suspects there may be a loose coax cable to the primary
PMS antenna. If the antenna checks out fine, the crew will still leave
The PMS station connected to the backup antenna until the March time
frame. This is because the crew will be very busy with many other
experiments and will not have much time for a low priority experiment
such as the PMS.

The only limitation they have with the current backup antenna, is the
Diplexor filter which is required for the SAFEX and PMS to share the same
antenna. This would prevent any 70 cm experimentation from the Kenwood
TM-733.
[ANS thanks the MIREX team for this information]

SAFEX, MIR 70 cm Repeater (Uplink 435.750 MHz FM, Downlink 437.950 MHz
FM, subaudible tone 141.3 Hz)
During last weeks momentary Mir attitude control computer shutdown. The
Mir crew temporarily shutdown the Amateur Radio station for a few days.
The PMS system was turned back on, but it is not known when the crew

plans on turning on the SAFEX Repeater.

MIREX has created an Internet Web page containing information regarding Mir and the various Amateur Radio experiments taking place from the space station. The pages are still "under construction", but some good information can be gathered from what has been put together. URLs include the following:

OSCAR-11
(Downlink 145.825 MHz. FM, 1200 Baud PSK. Beacon 2401.500 MHz)
Operating normally.
OSCAR-11 REPORT 14 January 1998
During the period 16 December 1997 to January 14 1998 the satellite
has continued to provide good signals on its 145.826 MHz. beacon,
although occasional interference has been caused by DOVE, which
transmits near this frequency.

Interest in the mode-S beacon continues, as stations prepare for P3D.
Four reports have been received. Stacey W4SM reported S3-4 signals
compared to an S2 noise level. Dove was S8. He uses a two foot
diameter G3RUH dish with 2.5t helix, and SSB converter. Manfred
XE1ZBO in Mexico City has received strong signals, using a Conifer
partial dish, and SSB converter. Mark KE7NS reports good signals,
above an S7 noise level. He uses a 21 element beam, Aircom pre-amp,
and Drake converter. Many thanks for those reports.

The telemetry is nominal. Internal temperatures have continued to
fall, and at the present time are 6.4C and 4.2C for battery and
telemetry electronics respectively. This fall in temperature is due
to increasing solar eclipse times, which are expected to reach a
maximum in early February.

Two WOD surveys have been transmitted during the period. Both are of
channels 10, 20, 30, 40 (+Y, -X, +X array currents, array voltage),
and are dated 14 December and 06 January respectively. They show
the effect of solar eclipses, on array currents, and voltage.

The new format AMSAT-UK bulletin, No. 114, is now being transmitted.
This contains details of amateur satellite frequencies and modes of
operation. It is intended to be a 'fixed' message, which won't
become out of date too quickly. It may however be changed from time
to time, possibly at monthly or greater intervals. Regular listeners
will note that the new bulletin makes a different sound compared to

previous bulletins, rather like a new form of binary data. This is because the bulletin contains regularly placed blocks of spaces, instead of random text characters.

The operating schedule is unchanged.

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

There are also additional status blocks after each bulletin is transmitted, and between ASCII TLM and WOD.

The mode-S beacon is ON, transmitting an unmodulated carrier, but telemetry indicates that it has partially failed, and delivering half power. This beacon is a useful test source for those testing mode-S converters, prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing. Any reports of reception on 2401 MHz. would be most welcome. Please e-mail g3cwv@amsat.org.

The 435.025 MHz. beacon is normally OFF. However it can sometimes be heard when the satellite is being commanded by ground control, ie. within range of Guildford, UK. When the 435 beacon is transmitting, the 145 beacon is normally OFF. The data transmitted is mainly binary.

OSCAR-11 users are welcome to visit my web site. It contains some software for capturing data, and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis, which is continually being expanded, as new data is captured. The URL is -

Bernard good evening. Your right, most people compensate by tuning the TX freq. Me included. I guess as you become more experienced with sat ops you should know where your D/L will be. So you don't cause alot of QRM tuning around trying to find yourself. On the other hand if the person I'm having a QSO with tunes the rx freq I will do the same . As you become more experienced you will become better at this. If you want to set up a sced let me know via email, or look for me at 435.850 FO-20 and FO-29.

199. 2.1 GHz downconverter

Newsgroup: rec.radio.amateur.space
Date: 1998-01-25 00:00:00 UTC
From: Tim Hynde <hynde@flash.net>
Message-ID: <34CBDD29.5F548C77@flash.net>
Source record: 17121

I really enjoyed the article in QST regarding the downconverter from Drake. There was some mention however if you wanted to convert to say 10m or 20m instead of 144MHz there would be SOME LOSS involved since your adding another converter to go from 144 to 28 or 14MHz. I don't really understand this, inside a 2m all mode your certainly going to convert at least once, probably two conversions leaving you somewhere in the HF range.
Whats the difference between this and adding another external converter to take the 144MHz down to your favorite HF IF?

Tim Hynde, KA8DDZ

There is no physical basis for the statement that was made in QST.
Chalk it up to bad editing.

In any well designed receiver system, the system noise figure is
mainly determined by the first RF stage. I don't know either what loss
the article is talking about.

>Whats the difference between this and adding another external converter
>to take the 144MHz down to your favorite HF IF?

Using first an untuned 2GHz/144MHz converter followed by an untuned
144/28 MHz converter followed by a tuned HF-receiver can be
problematic, if there are strong signals near (within a few MHz) of
the wanted signal at 2 GHz. If the converter stages have a lot of
gain, the second converter or the HF receiver front end might be
overloaded by the unwanted signal, since the first stage with some
selectivity is the roofing filter after the first mixer in the
HF-receiver.

If there are strong signals close to the wanted signal, the best
solution would be to use a VHF multimode, since the roofing filter is
now closer to the antenna with less gain ahead of it.

When the number of conversion stages is large, there is always the
risk of spurious responses.

Using such extremely low first converter outputs as 14 MHz or 28 MHz,
would totally ruin the image response performance, since the image
frequency would only be about 1 % resp. 2 % from the wanted frequency.
Even if there were no unwanted signals at the image frequency, there
are still the broadband noise from the sky, from the warm earth and
from the 1st RF amplifier. Unless the image frequency is attenuated
with at least a few dBs, the total random noise power within the final
audio passband would be twice (3 dB noise figure penalty) compared to
a receiver with even some (3-6 dB) image frequency rejection. However,
if the 144 MHz first IF is used, the image frequency is 14 % away, so
any front end selectivity would drop the broadband white noise image
response to insignificant values.

Performance-wise, they should be much better. However, that is only if you have them on two seperate booms but not too far apart (3 wavelenghts) and also is you cut the impedance transformers and phasing lines perfectly. For those you need to use 70, 72 or 75-ohm coax. That is the part I am wondering about myself as I am about to do exactly what you're doing. I have seen the cable used to be 70, 72 and 75-ohm.
If anybody else knows the answer to THAT one, maybe they could pick it up here. . . .
Good Luck & 73,

204. Kenwood VM7A : works on 9600 bps pacsat?

Newsgroup: rec.radio.amateur.space
Date: 1998-01-26 00:00:00 UTC
From: Ken Harris <kjh@shoreline-studios.com>
Message-ID: <01bd2a19$70ada8a0$010000c0@nt2>
Source record: 17126

Is it possible to use the Kenwood VM7A for 9600 baud Pacsat?

I think you need cross band full duplex for Pacsat.

What is the smallest radio for 9600 pacsat?

=========
SpaceNews
=========

MONDAY JANUARY 26, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* InfoEspace NEWS *
==================
Mike, VE2TRV, has made some adjustments to the Laval Laurentides ARC Web
site, so InfoEspace, the French translation of SpaceNews, has been moved
to its own subdirectory. The number of files in the /ve2crl directory was
becoming too large to manage efficiently. The latest edition of InfoEspace
is now at the following URL:

http://pages.infinit.net/ve2crl/infoesp/space.htm

Work is currently underway to have archives of InfoEspace available at the
site. The download page will be accessible via a link on the main InfoEspace
page, and the files will be compressed using PKZIP. The changes should be
completed by the end of January.

InfoEspace is in its fourth year of publication, serving French-speaking
amateur space fans since mid-1994.

[Info via Mike Detaille, VE2TRV]

* FUJI-OSCAR-29 NEWS *
======================
A memory error was detected in the onboard computer system of the FUJI-3
(FO-29) satellite. Restarting and software reloading is currently being
carried out, but the process is taking a long time due to poor uplink
efficiency. The operating schedule previously announced for FO-29 has
been cancelled. The satellite will remain in analog mode (Mode JA)
continuously untuil further notice. A new operating schedule is
expected to be announced shortly.

[Info via Kazu Sakamoto, JJ1WTK]

* AMSAT-OSCAR-10 WOBBLE *
==========

Recent observations suggest that the AMSAT-OSCAR-10 satellite is no longer stable in its Z-axis (the normal axis of spin), and is slowly tumbling or "wobbling" in orbit. The satellite is currently going through several deep periods of signal fading with a measured cycle of 15 to 20 minutes, and this condition will make it difficult, if not impossible, for spacecraft controllers to accurately predict AO-10's functional status over long periods of time. If the present trend continues, AMSAT-OSCAR-10 will simply continue to show periods of slow signal fading followed by periods of rather strong signals over a cycle of multiple minutes as a result of the Z-axis wobble.

[Info via Stacey Mills, W4SM]

* TEACHER SELECTED FOR ASTRONAUT CORPS *
==========

NASA has selected Barbara Morgan, an elementary school teacher from McCall, ID, to join the next astronaut candidate class as a mission specialist, and she has accepted.

In a decision that re-emphasizes the importance of NASA's strong commitment to education and its unique position to advance the Nation's goals to improve science, mathematics, and technology education, the Agency has determined that it is appropriate to include educator mission specialists in the astronaut corps.

In addition to meeting the astronaut selection requirements, mission specialists with education and teaching backgrounds in science, mathematics and technology will be selected and trained in the astronaut corps. These mission specialists will carry out educational programs in addition to their other assigned flight duties.

[Info via NASA]

* MIR AMATEUR RADIO STATUS *
==========

The Sputnik-40 Amateur Radio Satellite went silent around December 30, 1997. The satellites batteries lasted 4 weeks longer than expected. Overall, the project was a complete success. It generated lots of interest in space and satellites around the world. School children everywhere were tuning their radios to listen for the beep, beep, beep of Sputnik-40. Congratulations go to everyone involved in the Sputnik project.

Those fortunate enough to hear the signal from Sputnik before it went silent can send away for a SWL (Short Wave Listener) card from one of two addresses. Listeners who heard the satellite on more than one occasion should only send away for ONE (1) card. In an earlier report, an incorrect zip code and old city name name were included in a QSL address. The good news is that people who used the old address do not have to worry. Most of the cards addressed to the old address are being delivered to the correct address.

Include with your card the date and UTC time the signal from Sputnik-40 was copied. Envelopes should be well sealed and not include cash. Send an SAE (Self Addressed Envelope) and one or two IRC coupons (which can be purchased at major US post offices) with your request. Do not make any notes on the out side of the envelope with Amateur Radio call signs visible. Dave Larsen, MIREX / N6CO is not handling SWL cards for Sputnik. Please use the address below.

QSL Information for SWL (Short Wave Listener)
Sergej Samburov
PO Box 73
Korolev-10 City
Moscow Area, 141070, Russia

There is another address that can be used to receiver confirmation of Sputnik-40 reception is the FR5KJ radio club:

FR5KJ radio club
College Jules Reydellet
103 rue de la Republique
97 489 Saint Denis Cedex
Reunion Island.

The Mir crew is expected to be very busy for the next two months. The 2-meter packet radio station was temporarily moved from the core module of Mir and installed in the Priroda Module. This move was performed to take advantage of the backup tri-band antenna shared with the SAFEX II repeater. The crew also installed a TNC recently, but due to the crew's heavy work load, the TNC parameters have not been properly configured. Mirex would like stations monitoring the PMS to please be patient while adjustments are made. The PMS is NOT fully operational at this time.

MIREX has created an Internet Web page containing information regarding Mir and the various Amateur Radio experiments taking place from the space station. The pages are still "under construction", but some good information can be gathered from what has been put together so far. URLs include the following:

http://www.ik1sld.org/mirex.htm OR
http://www.ik1sld.org/mirex

http://www.geocities.com/~ik1sld/mirex.htm OR

206. Need info on current amateur satellite situation

Newsgroup: rec.radio.amateur.space
Date: 1998-01-26 00:00:00 UTC
From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <34CC7E66.F1ACA746@sprintmail.com>
Source record: 17128

Have been off the air for several years, last satellite work was with Oscar 10 (maybe not remembering the number correctly). I'm interested in finding information on the satellites currently in operation, such as modes used. At the time I took down my satellite station, the Phase 3 birds had not yet been launched. Has that ever happened? Are there any in operation now with the high eliptical orbit that gives the long exposure time for North America? Any and all info appreciated.

207. DOVE-17

Newsgroup: rec.radio.amateur.space
Date: 1998-01-26 00:00:00 UTC
From: Eric Hoven <ephoven@eznet.net>
Message-ID: <34cd370e.0@news.eznet.net>
Source record: 17129

I would like to listen to the DOVE 17 satellite on 145.825 but I don't know what is involved. What mode is it X-mitting? Do I need anything special to hear it? I live in Rochester New York and have a 2-mtr J-pole about 25/30 feet in the air. Will this be enough to hear DO-17????

208. Satellite tracking software

Newsgroup: rec.radio.amateur.space
Date: 1998-01-26 00:00:00 UTC

Message-ID: <6aj8c6$sf2$1@onlink3.onlink.net>
Source record: 17130

Planning to get software for tracking satellites.
I downloaded the demo of Nova for Windows and it seems pretty good.
Considering buying it or another program.
What do most people use?
I am just thinking about doing something with satellites and curious how
people track them (which software is most popular).
A bit inspired by the article in QST about using A027 with a HT (inspired
enough that I went out and ordered the antenna the author used).

Get FODtrack from Amsat's FTP site. Why? For the following reasons:
1. It's Free!
2. It's is far more accurate than Nova (which in it's own right is VERY accurate)
3. Faster-not graphically based.
4. It can control rotators AND completely automate your station (track satellites you setup ahead of time or configure AND TUNE DOPPLER on radios with CAT control).
5. Very little disk space used. Less than a 1/2 meg! That's because it doesn't have graphics.

However, I am NOT bashing NOVA. By all means it's more FUN with all the fancy graphics and windows, EME stuff, radar view (My favorite) and not as stripped down as FODtrack.

If you have web access, try the AMSAT home page. Also AMRAD.

213. Hypothetical lunar transponder

Newsgroup: rec.radio.amateur.space
Date: 1998-01-27 00:00:00 UTC
From: pblase@aol.com
Message-ID: <19980127044400.XAA00520@ladder01.news.aol.com>
Source record: 16985

I'm doing a bit of a conceptual design project and would like some input from other hams. Suppose that there was a small packet transponder on the moon, probably using a 10GHz link (in the ham bands), perhaps able to return a reasonably real-time, or at least recent, picture of the surrounding area. What characteristics would you like it to have, so far as making it interesting to work via ham radio?

Thanks
KACMI

216. Eggbeaters

Newsgroup: rec.radio.amateur.space
Date: 1998-01-27 00:00:00 UTC
From: M Perry <mperry5@ix.netcom.com>
Message-ID: <34CE15AA.25A7@ix.netcom.com>
Source record: 16988

I'm thinking of adding a satelite rig to my shack,I'd like an antenna set up where I can work the birds as well as the terrestrial repeaters. I'm curious about the eggbeater antennas made by M2. Do they work well for regular repeater operations as well as the sats? like to hear some feedback from anyone who has some experience with these antennas.

Thanks.

Yep, sure will. I've heard dove on the rubber duck during low passes, 145.825 is a packet beacon and a voice ID also, if you have a TNC you can get a a report from Dove in ax.25. I don't know what all the data is but you can probably find some more info on the Amsat site, the voice ID says "This is Dove in Space" and it sounds like an old Votrax synthisizer, like your holding your nose.

Tim

The data is telemetry, system information/status. There are several decoding
programs on the net which will decode the data. Dove is a fine little sat!

All you need for DOVE is a two-meter FM receiver (an HT works
great) and a decent pass. The J-pole is a great addition. To make sense
of the data that is coming down from DOVE, you'll need a TNC and a
computer. One the data is copied, you can run it through a decoding
program to determine what information is coming down. DOVE is a tiny
satellite, but an absolute thrill to catch. How I long for the days of
Oscar 21!

In my opinion, compared to geosynchronous or Molnya type orbit (AO-13,
Phase3D) satellites, the only benefit of a lunar transponder is that
you do not need a satellite tracking program to track the transponder
on a clear night :-). The transponder would be useless for daytime
operations (unless the transponder is nuclear powered) due to the two
week long lunar night.

The transponder beam width should be about 2 degrees wide to cover the
whole Earth with little spillower. At 10 GHz a 1 m antenna would be
sufficient, however, the antenna would have to track the Earth due to
libration. If a smaller antenna with larger spillower is used, there
is no need to constantly track the Earth, after it has been initially
pointed towards Earth, since the Earth would be within the wider cone.
Remember that the Moon turns always (nearly) the same side towards the
Earth.

The main problems are (in addition to getting the transponder to the
Moon) are the increased path loss (20 dB more compared to GSO or GTO
and 40 dB more compared to LEO) and the huge (2.6 s) roundtrip delay
(which would probably be noticeable even at 1200 bit/s AX.25 packet
:-).

222. Turnstile Ant Question

Newsgroup: rec.radio.amateur.space
Date: 1998-01-28 00:00:00 UTC
From: Dale Wentz <dwentz@accessus.net>
Message-ID: <01bd28c2$fc7f2780$a32404d0@dragon.mcs.accessus.net>
Source record: 16994

I have not been able to find the answer to this one.

Is the ground plane screen or elements on a turnstile antenna grounded, or should I seperate it from the mast ground.

Thanks, and 73's de kb9jja/dale

223. AEA 2232

Date: 1998-01-28 00:00:00 UTC
From: seal2cc@aol.com
Message-ID: <19980128122401.HAA26705@ladder03.news.aol.com>
Source record: 16995

Hello all, I've got available to me a nice AEA 2232 for a decent price..about 4-5 yrs old - 12/93 firmware, Is this the way to go for both current satellite capability (ie 1200/9600 birds) and for adapting to anything in the future? Is there a better controller both feature and pricewise that I should be considering? I have a PK 900 which I'm quite pleased with and know it can be adapted to 9600 but Im going to keep it in configuration as RTTY/TOR etc on HF and for cluster.

Thanks for any ideas/help. Chris Carey NQ4E

224. Looking for APT-pcmia

Thanks.

I use an Eggbeater for my uplink to RS-12, RS-15, and AO-27. It performs quite
well for these birds. Performance for repeaters would be less than ideal,
though, because the Eggbeater exhibits horizontal polarization at the horizon,
and most repeaters use vertical polarization. For close repeaters, it would
probably work well enough, though.

It doesn't matter, performance-wise. The one I built was insulated from ground
(wood frame), but I have seen others which are qrounded.

Source record: 17001

I have been trying to get decent performance using a Yaesu FT290 w/ a 100 watt amp (giving 80 w PEP) into a 3 el beam on an AZ/EL rotor with RS-12. On SSB I can barely hear myself on the downlink, CW seems to work OK. It seems to me that I should need much less power than I am using. Does the fact that the sat is in KA mode have anything to do with my problem or is there a problem on my side?

Mark:

I also enjoy fishing. I have a simple Garmin model 38 GPS receiver. It can be programmed to display the "Maidenhead" map datum which is the grid square system we hams use. It would be a good way to know what grid square you are in when doing mobile work. I suspect that most all the Garmin's also display the Maidenhead datum, but I am not sure.

BTW thanks for the QSOs on AO13 and FO20.

Bernie:

I think that most everybody on FO20 and FO29 still follows the convention of leaving the transmitter alone and adjusting the receiver. I have found, however, that this falls apart somewhat under two circumstances: 1) when a station has a really high angle pass which causes the dopler to shift really fast from plus to minus and 2) when one station is going plus dopler and the other is going minus. Great temptation to want to keep the transmitter on the receive frequency so you don't get lost under these circumstances. I'd bet that this is what happened during your qsos.

Well, I'd like to have it last longer than two weeks ----

consider how hot the lunar surface is during the day time, and how cold it is at night. How can you build your electronics boards which will flex as they expand and contract - and eventually pop a solder weld? If you're NASA you can afford the paperwork required for a nuclear heater, but if you aren't ---

Is it going to operate only during the lunar daytime, or are you going to have a nuclear power source (or really humongous batteries) to go through the two week lunar night?

And how are you going to get the system down to the moon's surface? It's actually more difficult to softland a package on the moon than on Mars! (Mars has a little bit of atmosphere - enough to use heatshields, balloons and all sorts of other neat things to reduce velocity).

Another concern is the path loss. Certainly an active repeater is better than moonbounce, but consider the distance to the moon (238,000 miles) and the beamwidth of your signal by the time your signal reaches the moon.

Every now and then somebody comes up with the idea of putting an amateur repeater on the moon's surface. I'm not saying it can't be done - but you should be aware of some of the problems before you want the idea to be taken seriously.

I use an Eggbeater for weak signal work on two meters, low earth orbit satellites and repeater work. The antenna works great. Mine is up 15-20 feet and I can work 150-200 miles on ssb/cw almost any day of the week. Also have no trouble accessing the RS birds.

As far as repeaters, we have many here in St. Louis and I dont really notice any difference between their signals with the Eggbeater and what they were with a Ringo vertical that I had previously. I am sure there is a difference (atleast 20 db) but the local repeaters are so strong that I dont notice the differnce. I can access one repeater 40 miles away with 5 watts.

I say go for it. 73 de Dave, N0IT

I don't see that the electronics would get much hotter or colder than the amateur satellites that hams have been putting up in space for years.

There's no atmosphere, so any heating would be mostly by radiation. Reflective surfaces and insulation should be more than adequate. And if I recall correctly, lunar soil is a poor conductor of heat anyway.

> Is it going to operate only during the lunar daytime, or are you
> going to have a nuclear power source (or really humongous batteries)

You put whatever batteries you can carry in it, and if they get low, then you power down, just like the satellites.

> And how are you going to get the system down to the moon's
> surface? It's actually more difficult to softland a package
> on the moon than on Mars! (Mars has a little bit of atmosphere

Why is it more difficult? The lunar gravity is less than that of Mars (1/6's earth gravity vs 3/8) and the vehicle will be going much slower when it gets to the moon. Not trivial to be sure, but not impossible.

Maybe if NASA was something other than a high-tech jobs program, we'd have a moon colony by now. Oops, wrong thread.

> Another concern is the path loss. Certainly an active
> repeater is better than moonbounce, but consider the

So what's the problem. I recall an article in QST discribing a setup used by one amateur to listen to the Apollo landings 30 years ago at ~2300MHz (I think). And we have much better components nowadays.

Gary Coffman did a back-of-the-envelope calculation in another thread that showed it should be possible to listen to the Lunar Prospector using amateur radio type equipment. Again, not trivial, but nowhere near impossible.

> Every now and then somebody comes up with the idea of putting

I don't think anyone is taking it seriously. AMSAT is having enough trouble getting Phase-3D into orbit. It's just a pleasant daydream. Sometimes all you can do is dream, you know? But you don't have to take a flamethrower to it.

It is correct that they CAN be coplanar, but the phase advance can also be gained by putting one of them in front of the other. They are not connected at their intersection at the mast if coplanar - they are electrically separated by the phasing harness ('delay line').

> AJ KT4KM

Well, you start out at 80w at the amplifier, but how much is being
delivered to the antenna? If you're like me, you lose more than
half of your power before it gets upstairs. (And I have to keep
reminding myself that means I lose a lot of receive signal, too!
Gotta get some hardline up!)

I'm using an Icom 271H.. 100w at the transmitter.. through 65' of
RG-8, which measured about 30-35 watts at the far end (what's that,
about 5.0 db/100' of loss?). I feed that into an 11-element
yagi at 48' and find that at the horizon, I need all of the power
in order to hear my signal about equal to the other folks. When
RS-12 is closer, I can cut the power back and still have a good
downlink. And that didn't change for me when the bird went into
KA mode versus Mode A only.

Of course, I also have a built-in attenuation factor since the
yagi is fixed at the horizon, so that helps keep the excess ERP
away from the satellite when it's overhead.

Are you receiving the downlink signals well?

[snip]
> Are you receiving the downlink signals well?
>
> 73 Wayne N5WD

Wayne has hit the nail on the head with this one!!
80W is more.. let me repeat that MORE! than enough
power to work RS-12.

I have worked several stations using less than 10W,
and most of them closer to 5W.
(This with a colinear antenna)

I would recommend that you work on your receive station..
remember, your uplink
should not be any louder than the beacon..
The issue is not what you are sending up,
it is your ability to hear what is coming down....

Good luck!

Unless you're going to be doing a controlled, powered landing, the lack
of atmosphere on the moon means you're going to have a very large
splat
when you get there. Parachutes and airbags are sufficient to get to the
surface of Mars without too much effort. And the Martian atmosphere
does
mean that you'd likely be going slower when you start braking than
trying
to land on the moon.

Source record: 17021

AJ,

New to satellites, I've been working RS-12 with an Icom IC-211 and a 28 watt amp into a half wave ground plane. My signal comes down just fine. I am finding that I am getting in better than I am receiving. This becomes evident on the lower passes when I hear stations in the noise level trying to get back to me.

To receive, I am using a Grundig YB-400 sw radio with a turnstile antenna and 50 feet of coax. I am in the process of re-designing the antenna for better reception. I'm certain that this will help.

Again, I'm a relative beginner at sats, but if you are getting good signal reports from terrestrial stations with the FT-290, it sounds to me like you need to look at your receiver or receiving antenna.

Good luck,
John, KB2YJH

Hearing DOVE doesn't take much - I've done it with a handheld
and a rubber duck.

All the tracking programs are more-or-less good, since they all
implement the same orbital models. Folks post orbital data
on this newsgroup, and you can find pointers to archival sites
on the AMSAT web page (http://www.amsat.org).

What introductory material do you have? What questions does
it not answer?

>delay
line is necessary.

They are coplanar, with a 1/4 wave delay line of 93-ohm (RG-62) coax if using
50 ohm feedline.. Mount them approximately 3/8 wavelength above the reflector.
Mine performed quite well on RS-10 and -15. I most recently opted for the
Eggbeater for a smaller footprint (less likely to tick off the neighbors.....)

You may want to use a pre-amp on your downlink antenna. It's highly
recommended to increase the recieve signals.

Are there any high-altitude ham ballooning groups in Virgnia, more specifically in the Richmond area. If not, what is the best way to get started. We already are thinking of a very simple design (beacon and antenna in laminated styrofoam beer cooler powered by 15 volts of lithiums with radar reflector, parachute and MAX 800-gram balloon) and for added ease of recovery an altitude-triggered balloon-popping device so that the first time around we can purely practice.
Any suggestions?

>recall correctly, lunar soil is a poor conductor of heat anyway.

The situation is quite different from amateur satellites. On the moon,
it is two weeks of intense heat and two weeks of intense cold and in
that time all components will reach thermal equilibrium anyway, so it
is no point of using thermal insulation. In fact the low thermal
conductivity of the lunar soil worsens the situation, since the
surface layer will quickly adjust to the external environment, so the
repeater would have hot on all sides or cold on all sides.

The scientists were positively surprised, when the early Surveyors
woke up after the first and even the second lunar night. Lunahods had
their electronics in a pressurized compartment, which was kept at
reasonable temperatures during the night by a nuclear battery (natural
decay of some radio isotopes) while the motors were solar powered and
the vehicle could move only during the day.

An amateur satellite in high elliptic earth orbit has hot on one side
and cold on the other side and if it rotates slowly, the average
temperature remains quite bearable.

A satellite at LEO will always have one side facing the relative warm
earth (300 K) while the other side faces the hot sun or the cold sky
and this condition changes each hour. Thus the thermal radiation
budget does not fluctuate very much.

The thermal problems in an amateur satellite is definitely more easy
to solve than in a transponder on the surface of the moon.

I wrote too quickly. You are correct, parachutes make landing much easier
and they do work much better with an atmosphere. :-)

But that only makes it more difficult, not impossible.

Oddly enough, I think getting a hypothetical lunar transponder into LEO
would be the most difficult part of the mission; i.e., getting space on a
booster, clearances (legal and political), the actual landing is merely
engineering (merely?!?!).

Jell filled bags _is_ the way the next lunar landers are going to work.
The joke at one of the labs was you could use off-the-shelf Jello,
but only lime was certified. :-)

And remember the Russian landing attempt the day before Apollo 11 landed?
Very oblique angle. The _structure_ survived, and did not make a crater.

Just bolt it onto something going there! It doesn't have to land.
I'll bet some of the SEDS groups would be willing to help on this.

Hi, I am new to this group. Can someone explain to me, what the purpose of a lunar transponder would be?

Also, what about other locations - what about in space itself? In a nice geosync orbit?

I think NASA could have some great PR value if they aided the hams in this way; to get something up there, that the common person could "play with". If you want NASA to help you, the only way is if they can get some PR value.

I would love to see a camera somewhere up in space, either in orbit or on a body somewhere, that kids on the web could control. There are camera's now, on earth, that you can control over the internet. Like a camera that views a cityscape - you can give commands to point it, and to zoom in or out.

Since NASA could bring along your device, presuming it was small and lightweight, and the internet would allow everyone to give commands to some central point, you ham guys have quite an opportunity to come up with an interesting proposal.

Why not propose something to NASA? They love things that are cheap and full of PR.

Eric, do a Yahoo search for 'amsat' and 'satellites' you'll find several sites that contain the data needed to track Dove, these elements are updated every day, especially when there is a space shuttle up since the data changes for the shuttle everytime they do a burn. Download the data and save it in a text file format, somewhere in WinOrbit it will have a selection to update the orbits or elements, just choose that, then select the text file you downloaded. That should do it.

Tim

I recalled in the late 50's, early 60's a proposal to land equipment on the moon inside a cork sphere! I don't think it was ever tried.

Jell filled bags sound kinda heavy, maybe jell-foam? Maybe some expanding foam like they use for packing? Hmm, that's _too_ strong, but there must be a wide variety of foam products. Maybe just airbags? The equipment will only be about 20 to 40 lbs, very large airbags landing at a very oblique angle? Hmm.

Not much is going that way. NASA (at least the mainstream) is not interested. :-(

There was a serious proposal by a group of investors to land a remote-controlled vehicle on the moon and then charge for exploration. Maybe they're looking for some communications engineers? We could work a deal. :-)

Heh, did you really say that? It is true that the package would be in
darkness two weeks out of four, but it would be odd indeed if those
two weeks exactlly corresponded with daylight/dark hours on Earth.
Hint: look at the Moon any time except at full moon. Part of its Earth
facing hemisphere is in darkness. And similarly, part of it is in sunlight
when it is daytime on Earth. Only at full moon and new moon is there
a 1 to 1 correspondence with the visible portion of Earth being in
daylight or darkness (and they are inversely related then).

>but if you aren't ---

This isn't an insoluble problem. Thermal coatings, or a simple parasol
sunshade can deal with the daytime heating issue. Good insulation can
deal with the nighttime cooling problem without resort to nuclear heaters.
This is a pretty problem, primarily revolving around handling *internally*
generated heat loads in daytime, but one that is within engineering feasibility.

>Is it going to operate only during the lunar daytime, or are you going to
>have a nuclear power source (or really humongous batteries) to go through
>the two week lunar night?

A possible solution, though novel, would be to use liquid sodium as a thermal
intermediary. Heated to a molten state in daytime by a solar concentrating
mirror, it would be stored in an insulated tank. In that tank could be a working

fluid loop which drives an expansion engine and generator for power. Waste
heat could be used to normalize spacecraft electronics temperatures during
the lunar night. In other words, we don't have to be conventional and use solar
cells as the primary energy source, or conventional secondary batteries for
energy storage.

Another possible energy storage alternative to secondary batteries would
be an ultra-flywheel. This isn't practical on orbiting craft because it would
act as a momentum wheel. But for a craft sitting on the lunar surface, it
would be a way to store energy with a higher density than is possible with
storage batteries.

>And how are you going to get the system down to the moon's surface? It's
>actually more difficult to softland a package on the moon than on Mars!

>(Mars has a little bit of atmosphere - enough to use heatshields,
>balloons and all sorts of other neat things to reduce velocity).

Yes, active braking is required. The package will approach the lunar
surface at about 1.9 km/s (lunar escape velocity if my memory isn't
faulty). It needs to be slowed to about 75 km/hr in order for an airbag
type landing system to yield the same effective G forces as Mars
Pathfinder withstood. But perhaps we can build it to tolerate higher
G loads. The electronics in artillery shells withstood thousands of
Gs back in the days of vacuum tube proximity fuses, doubtless we
could do a similar packaging job.

>Another concern is the path loss. Certainly an active repeater is better
>than moonbounce, but consider the distance to the moon (238,000 miles)
>and the beamwidth of your signal by the time your signal reaches the moon.

One way path loss is much more benign, and 2 degree beamwidth antennas
aren't large at 10 GHz. If we can copy Lunar Prospector's signals, and I'm sure
we can, we'll have little trouble copying signals from this guy.

>Every now and then somebody comes up with the idea of putting an amateur
>repeater on the moon's surface. I'm not saying it can't be done - but
>you should be aware of some of the problems before you want the idea to
>be taken seriously.

The biggest problem appears to me to be getting a ride above the Earth's
atmosphere for the start of the trip. Once over that hurdle, everything else
is just moderately clever engineering and packaging.

Realize that a satellite in space has the galactic background into which
it can radiate waste heat, and generally it takes advantage of that by
spinning so that the solar heated side is constantly being brought around
to where it can re-radiate to the cold galactic background.

A package sitting on the lunar surface faces a different situation. It is
not only subject to direct solar radiation (roughly 1.4 kW per square
meter of exposed surface), but it also gets *reflected* solar radiation
from the surrounding lunar surface. Now the lunar surface isn't all
that reflective, it is actually quite dark, but it'll still be a neat trick
to get a cold sink into which the package can radiate waste heat. It
can be done, but it requires some clever shading.

Well, yeah, but you need some way to keep the electronics warm during
that *long* night. Recall that's what NASA thinks ultimately killed Sagan
station. I made a proposal for that in another post.

Terminal velocity is about 1.9 km/s. That's still trotting right along.

>Maybe if NASA was something other than a high-tech jobs program, we'd have
>a moon colony by now. Oops, wrong thread.

Yeah, but point well taken. I was reading some of NASA's long range planning
documents from 1975 last night. According to that, our Moon colony now has
several thousand permanent residents, our first manned mission to Mars has
just returned, and we're working on an interstellar probe. But back then they

didn't think Proxmire would live so long, or that the spirit of Von Braun would slip away so fast.

Yep, I'm still satisfied with that rough calculation. A single long loop yagi should do it, and certainly any home TVRO dish would if retrofitted with an S band feed. In fact, I would have expected *some* amateur to have already done it. (I've been lazy since I know I have at least a year to do it.)

>scientific devices to do research of the Moon or other planets.

There have been a number of different spaceframes used for
amateur satellites. The basic structure of Oscar 10 or 13 (same)
would make a suitable space probe bus, but would be problematic
as a camera platform for other solar system bodies (they're pure
spinners, and the spin axis would have to be aligned to point their
high gain antennas back at Earth rather than at the target body).
P3D's structure would be better, it is 3-axis stablized. And all three
have integral kick motors which could be used to establish orbit
around another solar body. But all three are rather large for anything
launchable on amateur budgets to deep space targets.

Our itty bitty pacsats would seem ideal except that they aren't
self-stablized. That means you're stuck with omni antennas
on the spacecraft, and that means your link budget won't allow
deep space use. They might just possibly be usable in lunar
orbit, but it would be stretching things a bit. I have no idea
how you'd get them into lunar orbit, however. They have no
on-board propulsion system to brake them into orbit.

If memory serves, most of our other satellites are gravity gradient
boom stablized. That's Ok for a low orbit around a substantial body,
but doesn't work in deep space, there's still a problem with anything
but a 3-axis stabilized gain antenna (which they don't have) to get the
signal back to Earth. And none of them have kick motors for achieving
planetary orbit either.

Looks like P3D is the only bus we have that would be suitable, and
its relatively large size and mass mean it would be costly to get it to
a distant solar body. It hasn't been flight tested either, so that's another
risk factor. I wonder if its thermal control system would be adequate
for orbiting either Mars or Venus. It is rather much optimzied for
Earth orbit. Of course anything going inside the orbit of Venus or
outside the orbit of Mars has to be an entirely different animal.
On the one hand you get too much solar energy, and on the other
too little. You need nuclear power generators in either case.

Also, make sure your grade of coax is the best you can afford. The improvement in reception to be had going from Radio Shack RG-58 to a high-grade RG-213 (or even RG-8 - not 8x) can sometimes beat even the improvement from a preamp. Additionally, the better braid on the good coax will reduce the effects of local noise, improving your system's performance.

276. Weather satellite operations

Newsgroup: rec.radio.amateur.space
Date: 1998-02-01 00:00:00 UTC
From: lawrenceh@peverell.demon.co.uk
Message-ID: <34e46c8d.11290158@news.demon.co.uk>
Source record: 17048

For those interested in the weather satellites (wxsats) the following
are operational:

Polar orbiters:
NOAA-12 picture data (a.p.t.) on 137.50MHz and beacon on 136.77MHz.
h.r.p.t. on 1698.0 MHz

NOAA-14 picture data on 137.62MHz and beacon on 137.77MHz.
h.r.p.t. on 1707.0 MHz

NOAA high resolution pictures are available using h.r.p.t. hardware.

Meteor 3-5 picture data in sunlight only on 137.85MHz. [Nearing the
end of transmissions receivable in northerly latitudes. There will be
a gap of a few weeks.]

Equipment required to decode pictures is available from various
manufacturers - costs vary.

Geostationary:
reception depends on longitude:
WEFAX transmissions on 1691.0MHz
Meteosat-6 (also WEFAX on 1694.5MHz) at zero longitude.
Goes-8 75 degrees long.
Goes-9 135 degrees long.
GOMS at 76 degrees long.
GMS at 139 degrees long.
Fengyun-2 at 104 degrees long.

>Newsgroups: rec.radio.amateur.space
>
> Hi, I am new to this group. Can someone explain to me,
> what the purpose of a lunar transponder would be?

Well, the original poster was asking for suggestions for features for a hypothetical lunar transponder. He suggested a camera and a forward-and-store packet repeater at 10 GHz. (I think 13-cm up and 23-cm down is better, and I want to be sure it's a color CCD camera with pan, tilt, and a *good* zoom lens).

Unfortunately the probability of getting off the ground (figuratively and literally)
approaches zero.

> Also, what about other locations - what about in space itself?

There are many amateur satellites in orbit right now. And AMSAT is trying very hard to schedule the launch of their latest and most ambitious amateur satellite to date, Phase-3D. Checkout http://www.amsat.org/ for information.

> In a nice geosync orbit?

Oddly enough, 'slots' in geosync orbit are highly regulated and amateur satellites don't rate (I say oddly enough because it's not like there's not enough space out there or anything).

However, there are alternatives. When launched, Phase-3D will eventually be placed into a highly elliptical orbit which will appear to be almost stationary for hours at a time.

> I think NASA could have some great PR value if they aided the
> hams in this way; to get something up there, that the common
> person could "play with". If you want NASA to help you, the only
> way is if they can get some PR value.

Well, NASA often sends up a ham as crew on the space shuttle, and the american on Mir (I forget the name of the new guy) has an amateur license and amateur equipment he can use in his spare time (if he ever gets any), and NASA does get some publicity from that.

But generally, space on NASA launches are scarce as hen's teeth.
Interestingly enough, many (most?) of the early amateur satellite launches were piggy-backed on Air Force launches and later on European space launches. Offhand I can't think of any that were piggy-backed on a NASA launch (but I could be wrong).

> I would love to see a camera somewhere up in space, either in
> orbit or on a body somewhere, that kids on the web could control.
> There are camera's now, on earth, that you can control over the
> internet. Like a camera that views a cityscape - you can give
> commands to point it, and to zoom in or out.

Well, Webersat (UO-18, another amateur satellite) has a color CCD camera and there are weather satellites that transmit weather pictures that are fairly easy to receive. Yep, that's cool.

> Since NASA could bring along your device, presuming it was
> small and lightweight, and the internet would allow everyone
> to give commands to some central point, you ham guys have quite
> an opportunity to come up with an interesting proposal.
>
> Why not propose something to NASA? They love things that are
> cheap and full of PR.

Well, NASA is funny. Some parts of it are excellent, mostly engineers and scientists who haven't forgotten The Dream. Other parts of it, mostly managers and bureaucrats, are just marking time until they retire, and they're government employees so you can't just fire them to get them out of the way. Administrator Goldin (sp?) has made considerable improvements (I don't think the Lunar Prospector would have been launched if it wasn't for his faster-cheaper-better philosophy), but there's only so much he can do.

SB SAT @ AMSAT $ANS-032.02
CHANGE ON 75 METER AMSAT NET

HR AMSAT NEWS SERVICE BULLETIN 032.02 FROM AMSAT HQ
SILVER SPRING, MD, FEBRUARY 01, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-032.02

After eight years of exemplary service as NCS of the East Coast 75 meter AMSAT Net, Ron Long, W8GUS, is retiring to pursue other activities. He will continue to assist the new NCS when possible and will continue to support AMSAT in all of the other ways he has in the past. We all owe Ron a big vote of thanks for all of his past efforts and wish him success in his future endeavors.

Ron has groomed his successor, Al Tribble, W3STW, well. Al has been serving as Assistant NCS for some time now. Let's all welcome Al to this position and support him with lots of "check-ins" to the East Coast 75 meter AMSAT Net. As a reminder, this net meets on or about

3.840 MHz each Tuesday evening at 2100 Eastern time. It is followed at 2100 Central time by the Mid-America AMSAT Net, and at 2000 Pacific time by the West Coast AMSAT Net.

To join the ranks of AMSAT HF Net Control Stations, please contact Keith Pugh, W5IU, AMSAT-NA VP of Operations and express your interest. Keith can be reached by e-mail at: w5iu@amsat.org.

[ANS thanks Keith Pugh, W5IU, AMSAT-NA VP of Operations for this news.]

HR AMSAT NEWS SERVICE BULLETIN 032.03 FROM AMSAT HQ
SILVER SPRING, MD, FEBRUARY 01, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-032.03

The weekly 20 meter International AMSAT Net will be hosted by Keith Pugh, W5IU, AMSAT-NA VP of Operations , from the AMSAT P3D Integration Lab in Orlando, FL, on Sunday, February 15 1998. This net meets on or about 14.282 MHz at 1800 UTC for the "pre-net warm-up" followed by the ANS Bulletin Session at 1900 UTC. Wray Dudley, W8GQW, in Tubac, AZ, and Jack Butler, KB7UZ, in Great Falls, MT, will assist during the "pre-net warm-up."

As a special experiment in conjunction with the new Sunspot Cycle, Wray will simultaneously read the ANS Bulletins on 15 Meters at the old frequency of 21.280 MHz. Depending upon the success of this experiment, the 15 meter AMSAT Net may be re-activated on a regular basis.

Please check in with the AMSAT Net during this "special edition" for an up to date report on the P3D Satellite and on a regular basis to keep up with all of the news about the Amateur Radio Satellite Program.

Other activities in Orlando on the 13-15 Feb. weekend include the ARRL-AMSAT Satellite Workshop on 13 Feb. and the Orlando HamCation for the whole weekend.

[ANS thanks Keith Pugh, W5IU, AMSAT-NA VP of Operations for this news.]

SB SAT @ AMSAT $ANS-032.05
ANTARCTIC TRIP A SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 032.05 FROM AMSAT HQ
SILVER SPRING, MD, FEBRUARY 01, 1998
TO ALL RADIO AMATEURS BT
BID: $ANS-032.05

Ronald Ross, KE6JAB, report's that his trip to the Antarctic was a success and his portable satellite station a huge success.

Ronald's station (at 80S/81W) consisted of 2 eggbeaters on 7-foot bamboo poles 20 feet apart, on each side of our tent, a 70 cm SSB preamp, an IC-821, a KPC9612 and a laptop. I had to take a sealed lead acid battery, 12v 18A/Hr, but loaned a solar panel from the Cessna pilot. KE6JAB sent 70 messages of which 16 were JPEG images, using initially UO-22 and then KO-25 also. Those messages and images were posted on HIS website, which got over 700 hits during the operating period.

Three people contributed greatly to the success, Roy Welch W0SL, Jerry Smyth N8ULU, they downloaded from the birds for KE6JAB, and his longtime friend Ed Anderson KE6IZN, who did the web work. Ronald wishes to thank the many other people on the Amsat-BB list who answered his technical questions months ago when.

For all of his passes, KE6JAB was the only one working the birds over the pole, except, each morning ZX0ECF, LW5DGM. PY30G, XQ7GEE and a few others would be logged in. This was when the bird was working it's way down from S. America and over the Pole.

Ronald Ross, KE6JAB, states that"
The station generated a lot of interest amongst other people at the basecamp, they were amazed at the ability of an amateur "network" to provide such communications on a voluntary basis.
Especially when the official communications at the camp were having problems at 2400 baud over Inmarsat. I think Amsat has great resources

in technical knowledge and in it's members, and much to be proud of. "
The results of Ronald's trip can be viewed at http://www.thistle.org ,
as KE6JAB just got back, he will post more digital images in the coming
weeks.

[ANS thanks Ronald Ross, KE6JAB, for this report.]

MIR
The PMS packet station is current turned on, but it is not functional.
The Mir crew has just been to busy with other higher priority projects
to spend much time adjusting parameters on the PMS. The Mir crew has a
set of correct parameters for the TNC.
[ANS thanks the MIREX team for this information]

SAFEX, MIR 70 cm Repeater (Uplink 435.750 MHz FM, Downlink 437.950 MHz
FM, subaudible tone 141.3 Hz)
During last weeks momentary Mir attitude control computer shutdown, the
Mir crew temporarily shutdown the Amateur Radio station for a few days.
The PMS system was turned back on, but it is not known when the crew
plans on turning on the SAFEX Repeater.

MIREX has created an Internet Web page containing information regarding
Mir and the various Amateur Radio experiments taking place from the
space station. The pages are still "under construction", but some good
information can be gathered from what has been put together. URLs
include the following:

AO-10
(Uplink 435.030-435.18 MHz CW/LSB, Downlink 145.975-145.825 MHz
CW/USB)
Operational.
AO-10's signals are improving and are quite strong even at apogee, except
for periods of deep QSB, which can be largely corrected by changing
antenna polarization. These findings suggest strongly that AO-10 has
switched itself to its hi-gain antennas. There is probably a component of
Z-axis wobble accounting for the QSB. As illumination has
improved, the FM'ing heard earlier appears to have disappeared. The switch
to hi-gains would also explain the often poor signals near perigee when
the squint angle is particularly bad.

AO-10 is currently experiencing long (90 minute) solar eclipses with onset after apogee. The MA of onset will continue to increase and the length of the eclipse will continue to decrease until the period ends on February 23rd.

AO-10's apogee has moved into the northern hemisphere (ArgP > 180). Apogee will continue to rise higher to the north for the rest of 1998, peaking at ArgP = 270 in December.

I have updated my web page to include discussions of the above and updated, smoothed Keplerian elements.

http://www.cstone.net/~w4sm/AO-10.html
[ANS thanks Stacey Mills, W4SM, for this update on AO-10.]

OZ1MY reports, "AO-10 seems to improve every day. I had very good signals after the eclipse today (29-1-1998).
The fading is still very deep - but recovery is faster than 14 days ago. The eclipses last for approximately 1r hours now.
Had my first QSO with 9V1UV - and a small talk with VR2XMT, Charlie, who celebrated Chinese New Year.
Most of the time I ran 25 W to the old fateful 16 turn helix (G3RUH design) - with that the downlink was at 55 most of the time. The range was approximately 25,000 km at the start- down to 15,000 km when the bed jumped at me.
Using W4SM's ALON/ALAT I would say that the squint angle at the start was about 90 degrees - going up to 140 degrees at the end.
Signals were best with 90 degrees."

AO-27
(Uplink 145.85 MHz FM, Downlink 436.792 MHz FM)
Operational
[ANS thanks Michael Wyrick, N4USI, AO-27 Control-op, for this update]

FO-20

OSCAR-11
(Downlink 145.825 MHz. FM, 1200 Baud PSK. Beacon 2401.500 MHz)
Operating normally.
OSCAR-11 REPORT 14 January 1998
During the period 16 December 1997 to January 14 1998 the satellite has
continued to provide good signals on its 145.826 MHz. beacon, although
occasional interference has been caused by DOVE, which transmits near
this frequency.

Interest in the mode-S beacon continues, as stations prepare for P3D.
Four reports have been received. Stacey W4SM reported S3-4 signals
compared to an S2 noise level. Dove was S8. He uses a two foot diameter
G3RUH dish with 2.5t helix, and SSB converter. Manfred XE1ZBO in Mexico
City has received strong signals, using a Conifer partial dish, and SSB
converter. Mark KE7NS reports good signals, above an S7 noise level. He
uses a 21 element beam, Aircom pre-amp, and Drake converter.

The telemetry is nominal. Internal temperatures have continued to fall,
and at the present time are 6.4C and 4.2C for battery and telemetry
electronics respectively. This fall in temperature is due to increasing
solar eclipse times, which are expected to reach a maximum in early
February.

Two WOD surveys have been transmitted during the period. Both are of
channels 10, 20, 30, 40 (+Y, -X, +X array currents, array voltage),
and are dated 14 December and 06 January respectively. They show the
effect of solar eclipses, on array currents, and voltage.

The new format AMSAT-UK bulletin, No. 114, is now being transmitted. This contains details of amateur satellite frequencies and modes of operation. It is intended to be a 'fixed' message, which won't become out of date too quickly. It may however be changed from time to time, possibly at monthly or greater intervals. Regular listeners will note that the new bulletin makes a different sound compared to previous bulletins, rather like a new form of binary data. This is because the bulletin contains regularly placed blocks of spaces, instead of random text characters.

The operating schedule is unchanged.

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

There are also additional status blocks after each bulletin is transmitted, and between ASCII TLM and WOD.

The mode-S beacon is ON, transmitting an unmodulated carrier, but telemetry indicates that it has partially failed, and delivering half power. This beacon is a useful test source for those testing mode-S converters, prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing. Any reports of reception on 2401 MHz. would be most welcome. Please e-mail g3cwv@amsat.org.

The 435.025 MHz. beacon is normally OFF. However it can sometimes be heard when the satellite is being commanded by ground control, ie. within range of Guildford, UK. When the 435 beacon is transmitting, the 145 beacon is normally OFF. The data transmitted is mainly binary.

OSCAR-11 users are welcome to visit my web site. It contains some software for capturing data, and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis, which is continually being expanded, as new data is captured. The URL is -

280. Re: PH3D News

Newsgroup: rec.radio.amateur.space
Date: 1998-02-01 00:00:00 UTC
From: John Mock <kd6pag@qsl.nospam.net>
Message-ID: <34D52E89.4026@qsl.nospam.net>
Source record: 17052

No news yet that i've heard. (Hint: The next Arianne 5 test flight at present is reported to only hav the ESA's instrumentation package committed to it, and that might leave enough room, both in terms of mass and volume, to accomodate a strengthened P3D satellite.) Neither organization will say anything until the slot is committed (and maybe even wait well beyond that point), so we may only be able to go with rumors and speculations until they say something. A very small part of the amateur community was not very kind to ESA last time, so it is quite reasonable to expect the matter may be handled even more quietly this time.

Yes, I have looked at the lunar calendar and yes, this is an
oversimplification. As you said, _some_ part of the visible side of
the moon is in sunlight most of the month, however, to take advantage
of this, you would need several transponders, one at the left limb,
the other at the right limb.

Assuming only one transponder in the middle of the visible part at the
0 meridian at the equator, it will theoretically get first light when
the moon is in first quarter. In this February, this will occur on the
3rd/4th. At that time, over here in Finland, the moon will rise at
11:06 and set at 01:47 the following day local time. From this, the
moon would be highest (about south) at around 18:15 local time. So
from this, it would appear that we would have a nice usable evening
pass.

However, the rise and times are calculated for average atmospheric
refraction and represents the time the top of the moon (North pole) is
just over the horizon and it takes some time before the lunar equator
is over the horizon and even more before it is at a usable elevation
which is usable for communication (say 6 degree elevation), thus
shortening the usable communication time.

Now let's look at the situation on the moon. While the transponder at
the center meridian would theoretically get first light at first
quarter, i.e. the center of the sun would be at the theoretical
horizon. However, in most pictures from the moon (usually taken 1 - 2

m above ground level, the horizon is not very far, since there seems always be some craters in all direction. Unless you land on a rim of a crater, you will not see first light at that day. Even then, you would need a solar panel to follow the sun, which complicates the mechanical structure. Since the sun moves 180 degrees in 14 days, it takes about 1-2 more (earth) days, before the transponder is well lit and produce sufficiently of electricity. IIRC, it took a day or two before the Surveyors started to communicate after a lunar night.

Assuming the transponder would start communicating two (earth) days after local sunrise and looking for the lunar times over here for February 6th, I found that the moon will rise at 12:12 and set at 04:20, thus the moon would be in the south around 20:15. Each day the usable window will be nearly one hour later. The full moon occurs this month on the 11th, with local moon rise at 17:16 and set at 07:58 local time.

It is interesting to note that at high and middle latitudes, the time the moon is over the horizon varies greatly each month due to the tilt of the orbital planes and this is not synchronous with the phases of the moon. So next July, the full moon is on the 9th and over here, the moon is over the horizon for only over 6 hours from 22:34 to 4:23 local daylight saving time. So there is a very short communication window occurring at an unpleasant time. However, on July 21, the moon is up for over 17 hours from 2:44 to 20:12, but unfortunately the transponder would be in darkness, since the new moon occurs at 23rd. So, at mid and high latitudes, this variation would seriously affect application requiring daily contacts.

For tropical latitudes, the problem is less severe, since the moon is always up about 12 hours and it will quickly rise well over the horizon to usable elevation angles.

In order to maximize operation times at the times most hams would like to operate (in the evenings) the transponder would have to be on one limb of the moon so that it would receive sunlight quickly after the new moon but well before the first quarter, thus the most favorable operating times would be around first quarter. To get the best operation times around 21:00 local time, the transponder would have to be about 45 degrees from the lunar 0 meridian.

However, assuming that the transponder would be bolted to a scientific probe, there would not be much choice where the transponder would end up, since the scientific needs of the primary payload would dictate the landing site and we could end up in very unpleasant operating times in the early morning.

I assume that you are referring to the Tonto balls made of cork that
were fitted to the first Ranger hard landing probes. The idea was to
separate the balls (containing a seismometer) from the Ranger a few
hours before impact and use some retro-rockets to slow down the ball
to 50 m/s and hope that it would survive the impact. The main part of
the ranger would crash at 1-2 km/s. All the early rangers were
unsuccessful (most failed to leave earth or low earth orbit and some
missed the moon by a few hundred km or impacted on the invisible side
etc.). The last three Rangers were successful, returning thousands of
pictures before impact, but these late Rangers did not carry Tonto
balls to save weight, so we will never know, if these would have
survived the relatively slow impact.

The problem with soft landings on the moon is that you need to
completely kill the horizontal speed and almost completely kill the
vertical speed just before the altitude drops to zero. I once wrote
computer game (to be used on a hardcopy terminal in those days :-),
with realistic fuel economy, but newer succeeded in making a soft
landing. A few times I succeeded in killing the vertical and
horizontal speed, but unfortunately this happened at 300 - 1000 m
altitude and there was not enough fuel to get down at controlled
speeds.

IMO, to get a probe down to the moon in good health, the probe must
have good radars to measure both the horizontal and vertical speed as

well as altitude and also sufficient computer power to adjust the thrust locally due to the long signal round trip time (2.5 s). Landing on a flat area would not be too complicated, but flying over rough areas will cause large fluctuations in the altimeter and vertical speed readings and these readings would have to be filtered out before used to control the thrusters.

That should not be a problem if you use a one dimensional CCD array and let the rotation of the space probe do the other dimension.

The problem is that the rotation along the major axis is not always very clean, but in some cases there is some wobble, which needs also to be recorded and transmitted, so this can be compensated for when viewing the pictures. Pioneer 10 and 11 at their Jupiter (and Saturn) flybyes, used the rotation of the probe to scan in one dimension. The raw, uncorrected pictures looked quite horrible due to the wobble, but after processing, the pictures looked quite good.

The geostationary Meteosat scan the Earth twice an hour. The rotation of the satellite takes care of the east-west scanning, while a slowly tilting mirror took care of the north-south scanning feeding the IR radiation into an IR sensor.

The problem with mechanical scanned cameras is that you need quite a well lit objects to use high resolution (this is also why Baird failed to get his mechanical TV system accepted in England in 1936). While a two dimensional CCD camera (or any conventional camera tube) can accumulate photons for 1/25 or 1/30 s before being read out, a electromechanical TV camera with a one dimensional horizontal array can collect photons for about 1/16000 s and a fully mechanical system, (such as a Nipkov disk used by Baird) can collect photons for a single pixel at a time (much less than a microsecond), the object must be very well illuminated.

While these figures apply to TV-cameras for capturing moving objects, similar problems apply to rotating probes even with one dimensional sensors. If a probe rotates a few times a minute (say 4 times a minute, 15 s/rotation), and the object of interest covers 60 degrees field of view, it takes 2.5 s to scan across it. To get 1024 x 1024 resolution, the exposure time should be less than 2.5 ms or about 1/400 s for a one dimensional array. Using a complete mechanical system, the exposure time would also be in the microsecond range.

285. 150 MHz FM receiver for POCSAG pager needed!

Newsgroup: rec.radio.amateur.space
Date: 1998-02-01 00:00:00 UTC
From: ecn@bis.bg
Message-ID: <01BD2F68.1194A360@HOME>
Source record: 17057

Hi All,

My name is Evgeni Nikolov. Currently I'm working as an AS/400 programmer for Deloitte & Touche. In my free time I use to do some programming on PIC16F84 microcontroller (http://www.microchip.com/10/Datasheet/PICmicros/PIC16F8X/PIC16F84.htm) . Now I am working on a project witch combines PIC16 and a FM receiver. Together they can receive and decode POCSAG-coded paging messages from national service provider (in Bulgaria there are several). The digital part of the device is almost ready. But I have very litt
le experience with RF devices, so I need help very much.

The module I'm looking for is RF receiver and FM demodulator for 150.175 MHz. I prefer to be able to tune to different frequencies. The step is 20 kHz and deviation is 4 kHz. I2C protocol is preferable but any other is OK. I found many pager receiver chips, but they are rather complicated (have more than 10 coils) and don't have any tuning capability.

After some research I have found two chips from Phillips (TSA6057 and TEA6100 http://www-u
s.semiconductors.philips.com/cgi-bin/newsearch/pip?typenr=TSA6057&search=TSA6057 and http:
//www-us.semiconductors.philips.com/cgi-bin/newsearch/pip?typenr=TEA6100&search=TEA6100).
But as far as I can understand they need extra elements and I don't know how to connect each other. So - that is. Help!

Of course after (if) I finish this project I will publish it in my web page ((http://www.bis.bg/~ecn) for free and everybody will have it.

Thanx in advance.

Evgeni

I think I get it. The retro motor de-orbits it and the gel cushions the
electronics from the impact. Yipe!

I have seen in an old 73 Magazine(May89) an article about a Turnstile antenna called AANother Turnstile Antenna by ZL1AAN.In this article besides the horizontal collinear parts has a vertical element in the drawing ,which is shown as half wavelength long but is not shown to be connected anywhere and is not mentioned in the article .It is shown only on the drawing.Can someone clarify this?Thanks in advance

The retro fires during the last few minutes before impact. I don't know if it orbits first or not. If it does, than a shroud or something could stay in orbit, with our transponder attached.

One of the local hams who was very involved in amateur satellite work has just passed away. The following equipment is going to be sold.

Create roof mount tower with flat top and Create thrust bearing

Yaesu 5400 satellite rotator system with control head

Landwehr preamps for 144 and 432 Mhz

Cushcraft dual polarity antennas for 144 and 432 (2 ea for each band)

Homebrew roof mounting frame for Create tower

Large group of coax, rotator, and control cable for the system

Horizontal stacking mast for satellite antenna

Galvanized mast for mast for rotator

Will sell the entire set up for $1,000

AFAIK, the geosynch slots are only a frequency management issue.

On a specific frequency band, if you put more satellites on the
geosynch orbit, the ground terminals would have to use narrower
antenna beams. A narrower beam means a larger antenna (not nice to put
a big antenna on the wall). A narrower antenna beam is harder to aim
at the satellite. If the ground station antennas are fixed, the
satellite must be kept at exactly the same position on the sky,
requiring more station keeping fuel the more accurately the position
has to be kept. Without station keeping fuel, the satellite is going
to drift along a figure of eight path around the average position (as
seen from the ground), due to orbital variations, since the earth is
not a perfect sphere. The amount of available station keeping fuel
usually dictates the age of an geosynch communication satellite, not
the condition of the solar panel or transponders. It is the total
system economics that dictates the size of the orbital slot at a
specific frequency band.

Radio amateurs operate at different frequency bands, so there is no
conflict between the heavily used TV, telephone and data link
satellite slots.

However, some microwave amateur frequency bands are shared with
radiolocation (radar etc.) and other low profile radio, remote sensing
and other services. I don't think these services are the reason for no
geosynch amateur satellites.

To launch a geosynch satellite, it is first launched into a highly
elliptical geosynch transfer orbit. In fact the AO-10 and AO-13 are in

a geosynch transfer orbit (GTO). To get into a true geosynch orbit, a rocket stage must be fired at top of the GTO, to circularize the orbit into geosynchronous. If you can launch 1000 kg into GTO, the fuel required to circularize the orbit is several hundred kilograms, maybe even 500 kg, so the dry mass of the satellite could only be 500 kg and you would still have to make allowance for station keeping fuel. However, if the satellite is only intended for GTO, all the 1000 kg can be dry mass (antennas, solar panels transponders etc.)

As I understand it, because communications satellites usually share uplink
frequencies, they have to be spaced some number of degrees apart based on
some maximum allowed uplink antenna beamwidth so as to avoid interference.

To be honest, I'm not sure how non-interfering satellites (like weather
sats) are handled, but there must be some sort of coordination involved.
Perhaps a more enlightened soul would care to fill in this gap in my
knowledge.

Perhaps it's not inconceivable to reserve a space in geosync orbit for an
amateur satellite, but the cynical side of me says it's close enough.

295. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1998-02-03 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <6b5s0v$p2m$1@blackbird.afit.af.mil>
Source record: 17067

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from

archive.afit.af.mil (129.92.1.66)

in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-four character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01 Line Number of Element Data
03-07 Satellite Number
08 Classification (U=Unclassified)
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Day of the year and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
45-52 Second Time Derivative of Mean Motion (decimal point assumed)
54-61 BSTAR drag term (decimal point assumed)
63 Ephemeris type
65-68 Element number
69 Checksum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69 Checksum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 14
1 23455U 94089A 97320.90946019 .00000140 00000-0 10191-3 0 2621
2 23455 99.0090 272.6745 0008546 223.1686 136.8816 14.11711747148495

: The main problems are (in addition to getting the transponder to the
: Moon) are the increased path loss (20 dB more compared to GSO or GTO
: and 40 dB more compared to LEO) and the huge (2.6 s) roundtrip delay
: (which would probably be noticeable even at 1200 bit/s AX.25 packet
: :-).

But that's half the fun =) Id love to try and work through that =) Roll on "Lunar-Oscar One". Oh and once weve done that, let the real challenge begin...."Mars-Oscar One", now *that* would get interesting...15 minutes roundtrip delay.(And yes, I am a lunatic[pun intended] =>)

As far as the "increased path loss" goes, well we will have to just improve our recieve systems =). Actually, It might be a good idea to use 5.6GHz (C-Band), rather then 23cms/13cms, in order to reduce the noise factor.(See my note about it not happening any time soon - Im talking after 23/13 become a lot more common place than they are today, ie when 23/13 is the "entry-level" for OSCAR operation's rather than the 2/10/70 that is "entry-level" right now.

But seriously though, launch vehicle concerns aside, I don't think it is impossible to build a Lunar Transponder - true, the landing would be the hardest thing to get right, but at some point man is going to go back to the moon, no extra reasons why they couldn't take an Amateur Radio Transponder with them(and yeah, I know we would be the very least of the priorities, but Amateur Radio *IS* an official payload of the ISS.

I don't see an Amateur Radio Lunar Transponder happening any time soon, but I do see it happening. (And yes, Im a dreamer as well as a lunatic)

15-20 years ago there was an article in QST on doing Earth-Venus_Earth bounce!
The author determined that it was just barely feasible using technology
then available. This was really slow, redundant cw. I'm betting the
advent of DSP _alone_makes it doable now. I'm betting one-way between Earth
and Mars is too.

> But seriously though, launch vehicle concerns aside, I don't think it is
> impossible to build a Lunar Transponder

It is so likely that off-the-shelf will work, we should just bolt two of them
on and go. Re-use the Oscar SSB 1200 baud design. Leave it in lunar orbit.
Is anybody else interested? We don't necessarily need AMSAT to do this.

You might want to take a look at the following:

http://www.ee.surrey.ac.uk/CSER/UOSAT/missions/lunar/index.html

Not sure what the real status of this is, but there are a couple of interesting papers referenced.

Apparently more than that now. Everyone should go listen to the WAV
files. It is quite instructive. You can hear the doppler on the main carrier,
and clearly hear the data packets on the subcarrier. Good job.

Hi Ken

AMSAT-OZ newsletter has it that the ride is - perhaps - scheduled mid 1998.
According to AMSAT-NA they're abt. $270.000 short due to delays.
Look for more info via www.dxer.com choose 'satellites'.
Or go directly to http://www.dxer.com/satel.html

- look for me on RS12 (CW) in the spring ;-)

Could it be that a big lump of dirt (sometimes called Earth ;-)) could be between your scanner and the sattelite you try to receive at the time you try to receive it??
Is your antenna system up to speed? You need 'awful big ears' to receive a lot of the satellites.

Not all are 'GEO-stationary'. RS12 goes around the earth in 1.5 hours...

Best regards OZ1IVA, Lars

Same for downlink. But remember we *don't* share the frequencies with
them, so we can fill up an entire belt of our own and only have to deal
with interference between our own satellites.

The problem is not reserving a place, the problem is getting something
built and launched to be put there.
The satellite will be more complex because of stationkeeping, and it will
be usable only to 1/3 of the earth surface inhabitants, thus reducing the
number of potential supporters. You would need to build 3 and get them
launched to roughly 120deg different longitudes to satisfy everyone.
An elliptical-orbit sat has the advantage that it serves everyone, and
that it remains in the orbit without using fuel.
(well, if you are not extremely unlucky, that is)

I found them a while back. In fact, one possibility is to ask Surrey to build
the base spacecraft.

> Can someone explain to me, what the purpose
of a lunar transponder would be?

Well, that was the original question: what would you want it to do. Basically, like most of the other ham-in-space stuff: simply for the fun of it.

>Also, what about other locations - what about in space itself? In a nice geosync orbit?

Well, there are about a dozen amateur radio satellites up there now. I can't recall offhand if any of them are in GEO, but I don't think so. It would be a good place, but it's awfully crowded what with all of the commercial birds up there.

>I think NASA could have some great PR value if they aided the hams in this way; ...

Well, NASA does like to help the hams, but they can't afford to send up something special, and they aren't planning any lunar landers in the near future that I know of.

>I would love to see a camera somewhere up in space, either in orbit or on a body somewhere, that kids on the web could control.

I had definitely thought of that. One question would be: how to mediate control of the camera, since only one person could have it at a time. (aside from the problems of requiring a non-amateur band link for non-ham uses)

>Looks like P3D is the only bus we have that would be suitable, and
its relatively large size and mass mean it would be costly to get it to
a distant solar body. It hasn't been flight tested either, so that's another
risk factor.

Check out the lunar probe planned by UOSAT at:

http://www.ee.surrey.ac.uk/CSER/UOSAT/missions/lunar/index.html

This group has actually constructed a large number of the amateur radio
satellites. They point out that their probe design would be well suited for a
general purpose space probe bus.

is published every week and is made available for non-commercial use.

* STS-89 MISSION NEWS *
======================
Space Shuttle mission STS-89 came to an end on 31-Jan-98 at 2235 UTC with
a smooth landing on runway 15 at the Kennedy Space Center (KSC) in Flordia.
The primary objective of this flight was to rendezvous and dock with the
Russian space station Mir and perform a crew exchange of U.S. astronaut
David Wolf from Mir with Andrew Thomas from the shuttle. Andrew Thomas
is the last U.S. astronaut assigned to visit the Mir complex. Endeavour's
next mission will carry the U.S. Node Module to support the construction
of the International Space Station (ISS) in July.

[Info via the ISIR Newsline Digest]

* MIR 25 CREW LAUNCHED *
=======================
French cosmonaut Leopold Eyharts and two Russians, Talgat Musabayev and
Nikolai Budarin, were launched to the Russian space station Mir from the
Baikonur Cosmodrome aboard a Soyuz booster on 29-Jan-98 at 1633 UTC. The
three man crew aboard Soyuz TM-27, known as Mir 25, docked on 31-Jan-98.
Musabayev and Budarin will replace the current Russian crew aboard Mir,
Anatoly Solovyev and Pavel Vinogradov, who will return to earth in a few
weeks with Eyharts.

Soon after the Soyuz lift-off, the U.S. space shuttle Endeavour undocked
from Mir after spending a few days linked to the complex to retrieve U.S.
astronaut David Wolf, and leave astronaut Andrew Thomas and supplies for
the next few months. Thomas is scheduled to remain aboard Mir until May.
He is the last of a series of U.S. astronauts who have been aboard Mir:

Norm Thagard (Feb 95 - Jun 95)
Shannon Lucid (Mar 96 - Sep 96)
John Blaha (Sep 96 - Jan 97)

Jerry Linenger (Jan 97 - May 97)
Mike Foale (May 97 - Sep 97)
David Wolf (Sep 97 - Jan 98)
Andrew Thomas (Jan 98 - Present)

[Info via the ISIR Newsline Digest]

* SKN '98 BEST FIST WINNERS *
==========

Ray, W2RS, extends his thanks to all who participated in AMSAT-NA's OSCAR SKN '98. Although activity was down from prior years due to the loss of RS-10, the temporary loss of Mode K on RS-12 and the unfavorable position of AO-10, a good time was had by those who took part.

Once again our first-place winner was Rusty, NM1K, who received five separate nominations. Two more 1998 winners also had been nominated in previous years: G3RWL and W1NU. Joining the winners' circle for the first time in 1998 were AG2R, K4IPH and VE5SWL. Heartiest congratulations to all.

* AMSAT-OSCAR-10 STATUS *
==========

Stacy Mills W4SM, reports that AO-10's signals are improving and are quite strong even at apogee, except for periods of deep QSB, which can be largely corrected by changing antenna polarization. These findings suggest strongly that AO-10 has switched (glitched) itself to its hi-gain antennas. There is probably a component of Z-axis wobble accounting for the QSB. As illumination has improved, the FMing heard earlier appears to have disappeared. The switch to hi-gains would also explain the often poor signals near perigee when the squint angle is particularly bad.

AO-10 is currently experiencing long (90 minute) solar eclipses with onset after apogee. The MA of onset will continue to increase and the length of the eclipse will continue to decrease until the period ends on 23-Feb-98.

AO-10's apogee has moved into the northern hemisphere (ArgP > 180). Apogee will continue to rise higher to the north for the rest of 1998, peaking at ArgP = 270 in December.

Stacey Mills has updated his Web page to include discussions of AMSAT-OSCAR-10's status as well as smoothed Keplerian elements for the spacecraft. The URL is:

http://www.cstone.net/~w4sm/AO-10.html

[Info via Stacey E. (Chuck) Mills, W4SM]

* MODE-A REQUEST FOR COMMENTS *
==========

Richard W. L. Limebear, G3RWL, on behalf of AMSAT-UK, is requesting comments regarding the construction and funding of future OSCAR satellites carrying Mode A (145 MHz UP, 29 MHz DOWN) communications transponders. Based on comments and feelings expressed by some satellite users, it is

believed that:

1) There is a need for Mode-A satellites for new satellite operators to train on, as well as for those amateurs who prefer analogue rather than digital operations; and

2) The present supply of Mode-A satellites is fast decreasing with the demise of RS-10/11, problems commanding RS-12/13, battery troubles with RS-15, and the non-availability of RS-16. No Mode-A spacecraft has been produced by a Western group for the past 20 years (Oscar-8 in 1978).

AMSAT-UK is giving some consideration to this state of affairs but, before they go further, they need to determine whether a new Mode-A package would a) be wanted; b) be used; and c) be supported.

In other words, do satellite operators (ie: YOU) want it to happen? Is it worth someone's time and effort to design, produce, and launch such a satellite?

How many people would use a new Mode-A spacecraft? It would be pointless to spend several hundred thousand dollars if it only attracted a few hundred users (so the cost is 1000 dollars per user). Would YOU use it?

This several hundred thousand dollars doesn't just appear magically. The money has to be raised by satellite operators (ie: YOU). Would you give your own money to a group who promised to develop and launch a Mode-A transponder?

Richard asks that comments be directed to him by 28-Feb-98 via any of the following paths:

Packet: G3RWL @ GB7HSN

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,slac.rec.ham_radio,tw.bbs.rec.radio.amateur

CHINA HAM NEWS 2/4/97: BY1QH EME Schedule

Courtesy of Lasse (BY/)SM0KAK & David BZ1BM
Tsinghua University Amateur Radio Club, Beijing, China

* * * * * * * * * * * * * * * *

To members and friends of BY1QH.

You are all most welcome to participate in the following activity!
Please contact David BZ1BM or Lasse SM0KAK if you plan to show up.
Note that our cances of making a EME QSO before 1630 UTC (0430
local time Sunday morning) are not too good due to local QRM.

BY1QH WILL BE QRV ON 144 MHz ON SATURDAY, FEBRUARY 7
This is the first time we are QRV in a EU window except for last
ARRL contest. Make sure you are the first in your DXCC to work BY
on EME! So far only SM, W and VE have been worked from BY.

UTC
1130-1230 EME random.
1230-1300 TEP sked SSB 144.136 MHz with VK6XLR
1300-1330 EME sked with PE1LCH, PA2CHR tail end. QRG unknown NW.
1330-1600 EME random
1600-1630 EME sked with PE1LCH, PA2CHR tail end. QRG unknown NW.
1630-1800 EME random. From 1700 our local QRM is less bad!
1800-1830 EME sked with PA2CHR. QRG unknown NW.
1830-2035 EME random
2130-2230 CQ DX 1827 kHz +/- QRM, 400 W & dipole at 30 magl

During these hours we will be QRV on +86-10-90854674.

We will not accept more skeds (PE1LCH and PA2CHR have lent/donated
major parts of the station). On the other hand you are welcome to
send an e-mail to era.sm0kak@memo.ericsson.se telling that you
will be calling us, and what time periode you plan to be QRV. This
might help us to pick up your call sign. Will anybody be able to
be QRV in the first hour (1130-1230 UTC)? The moon will be below
the horizon in most parts of EU and NA then.

All RANDOM EME is on 144.136 MHz, using 2 minute timing, BY1QH
transmits in the "first" period. Please spread out +/- 1 kHz!!
(We will not move our TX)

We have lots of birdies and local noise. The QRM situation is also
not stable. If you spread out it makes it much more likely that
one of you picks a clear QRG! If you hear us and call us, please
do NOT give up even if we give no sign of copying anything! Keep
on calling. This goes for all stations, even if you run several kW
and lots of aluminium! Suddenly the QRM drops and we can copy you.
Stations like W5UN KB8RQ and VE7BQH have been totally impossible
to detect, and then after hours of calling and listening the noise
goes down. Also average size stations have a chance if you can
copy us. During the ARRL contest we copied 4 yagi stations
running 1.5 kW.

Station improvements since 1997 are:
Improved elevation readout at low elevation angles
New RX filter 250 Hz (500 Hz B4), and new PA.

Other equipment same as before:
IC-706 Mk2
SSB electronics pre-amp 0.8 dB NF in mast head
4x9 el Vargarda, total gain 17.7 dB
Stacking loss 0.5 dB, feeder loss 0.7 dB
QTH: LOC ON80DA
Tsinghua University in Beijing
73 ES CU VIA EME
Lasse (BY/)SM0KAK & David BZ1BM

311. DSS Dish -- what's in there?

Newsgroup: rec.radio.amateur.space
Date: 1998-02-04 00:00:00 UTC
From: Cathryn Mataga` <cathryn@junglevision.com>
Message-ID: <34D90330.1A102564@junglevision.com>
Source record: 16938

My friends, who bought two DSS receivers have given me their extra dish. Now, does anyone know if there's anything useful inside this thing? I assume the pre-amps and Microwave stuff is all in the Dish -- right? Should I just toss it out, or is there a project lurking here.

As with all maths-intensive programs, it works substantially better with
high-spec machines. If you've anything less than an 486DX2/66 you'll
need a fair degree of patience. It's not easy software to learn to
"drive", but worth the effort as it's probably one of the most
comprehensive and well thought-out freeware programs of any type.

>I also need the data to begin tracking it.
>
Element sets are frequently posted to this newsgroup. To update
WinOrbit's database, use the "Setup--Satellite database--Database--
Update from file" option to point to the new data file. WinOrbit should
ignore the header etc and pick out the relevant data. You don't really
need to update the database more often than monthly unless you're doing
time-critical work with low orbiters such as the Mir.

The dish (I am assuming RCA style) is always useful. Articles in QEX and QSL about feeding it for transmitting. For receiving ... the feed is a downconverter (usually around 10.7 - 12 GHz range downconverted to 950 MHz to 1.xx GHz range)

I assume the pre-amps and Microwave stuff is all in the
>Dish -- right? Should I just toss it out, or is there a project
>lurking here.

Always a project .... but unless you are planning on talking to another ham for two way... or use it for a possible 10 GHz receive for the future P3D beacon --- if an when.....

>Well, I'd like to have it last longer than two weeks ----

Well, me too. Note that this is still in the conceptual design stage, and what I'm mainly looking at right now is what it should do. I'll worry about how to do it next.

>...Is it going to operate only during the lunar daytime, or are you going to have a nuclear power source (or really humongous batteries) to go through the two week lunar night?

At this point I was figuring on operation mainly during the daytime, with a burst-mode "I'm alive" during the night to conserve power.

>And how are you going to get the system down to the moon's surface?

Interesting problem, isn't it?

>Another concern is the path loss. ...

Yes, that's the real kicker. However, if I do the calculations right, see the chapter in the ARRL Handbook on space communications, at 5 GHz and 10 kbps, 5 W out, a 2' dish on the moon should be able to talk to a 8' dish on Earth. This matches with some other spacecraft designs.

>Every now and then somebody comes up with the idea of putting an amateur repeater on the moon's surface. I'm not saying it can't be done - but you should be aware of some of the problems before you want the idea to be taken seriously.

Well, that's one reason why I'm asking here. I would greatly appreciate being able to get in contact with anyone else that has seriously looked at the problem and/or might be interested in looking at it again. No sense in reinventing the wheel, and all that.

remote-controlled vehicle on the moon and then charge for exploration.
Maybe they're looking for some communications engineers? We could work a deal.
:-)

There are a bunch. You are probably thinking of LunaCorp, but at last count
there are at least half a dozen different groups looking to launch private
lunar probes of one kind or another in the next 5 years.

An alternative is to land it at one of the places at the North or South lunar poles that is in constant illumination.

BTW, thanks for the input people, although the conversation seems to cover every topic but the original question: what characteristics would you like it to have?

318. APRS

I just got back from a meeting where a ham using APRS said that the system here in the Southeast has no intention of changing their freq (147.9) because the ISS wants to use 147.8 (did I get that right?). This ham said that to change would cost him $1000.00 because his receiver on his digipeater would not go below 145.0 mhz. He said that if the ISS operates so close to APRS we (hams) will just have to see who can get through.

Good Day to You;

Yes ! ! ! We do have the Drake 2880 Downconverters in stock.
These are new. We test them 100% before shipping.

Pricing is as follows:
$39 each or 3 for $100
Price includes Power Supply/ Inserter
and Shipping. Personal Checks are OK.
COD is an additional $5 per order.
All Orders are Shipped via Priority Mail.
(that way there is no long wait)
All orders are shipped the same day
(unless there is an earthquake, Hamfair,
Sunday or such that would keep us away
from the Post Office)

e-mail orders are accepted. Sorry, No Plastic.
a P.O. Box address is OK ! ! !

I look forward to hearing from you.

>I would really appreciate a basic definition of telemetry.

In a nutshell:

tele - transport across some space or distance
metry - quantifiable measurements

So telemetry is the ability to broadcast and monitor some form of measurement across some distance. For example, being able to monitor from the pits the RPMs on a race car anywhere on the course, or sitting in Houston monitoring the status (speed, altitude, etc.) of a spacecraft in orbit.

This typically takes two parts. First, the object being monitored has some device capable of broadcasting the desired information, either continuously or on demand. Second, a receiver must be used to receive the signal and make sense of it.

>Paul OH3LWR

The main problem with GTO, other than requiring ground stations to use tracking antennas, is the radiation dose the satellite gets passing through the Van Allen belts twice per orbit. That requires the satellite electronics to be much more rad hard than is the case for a GEO satellite. AO-10's computer failure is probably attributable to that even though it used expensive rad hard chips and tantalum foil shielding. The solar cells are also degraded by radiation.

On that subject, and the semi-related one of thermal stress, does anyone else remember the GE TIM? The TIM, Thermally Integrated Module, was essentially a vacuum tube IC designed for space use and also other high radiation environments such as nuclear reactor cores. The individual tube elements were electron beam etched, and the whole thing was heated to generate emission (cathodes were doped). It wasn't exactly VLSI, but it was robust as all get out. Solar heating, with a concentrating mirror, could be used to stimulate emission, so the only operating power requirement was for the plate supply, a few volts, and the grid supplies, also only a few volts because of the very small element spacings. Gates, flip-flops, and other SSI circuits were produced before TIMs were abandoned. It was eclipsed by RCA's higher density silicon on saphire technology, but it is an interesting road not taken.

Since we have an infinite supply of vacuum and plenty of available solar heat, something akin to the TIM really is attractive for use on the lunar surface or in a high radiation orbit. Bigger open frame power tubes are possible too. A TWT without an envelope, and with a solar heated cathode, is a possibility. I've ocasionally thought that space would be a good place to revisit the vacuum tube. In LEO, we could use a conductive tether to generate HV for some serious power tubes.

Hi Kris

Telemetry is one-way radio transmissions used for tracking and
measurement data.

Example -- telemetry is used to send data from a rocket missle to a
ground station. The data might include temperature, acceleration,
velocity, fuel consumption, battery voltage etc.

telemetry (te-lï¿½mï¿½ï¿½-trï¿½) noun

Measurement from a distance.
The science and technology of automatic measurement and transmission
of data by wire, radio, or other means from remote sources, as from
space vehicles, to receiving stations for recording and analysis.

332. Help with RS10-12

Newsgroup: rec.radio.amateur.space
Date: 1998-02-07 00:00:00 UTC
From: jagg@global2000.net
Message-ID: <34dc4ed1.304499@news.global2000.net>
Source record: 16954

I am new to space communications. I had been monitoring using the
Logsat program. Interestindly at 7AM (2-7-98) INSTEAD OF PRIDICTED
RS-10-11 I heard the RS-12. Is that common?
Secondly I tried ssb on 145 (8watts to 8db vertical) and also
15 watts to a 2-el yagi on 21 mhz. I didnot hear anything on the down
link on 29 mhz(using two seperate trancivers).
Would some one please tell me what I should do (which frequencies and
what power)?
I greatly appreciate your help. Thanks 73 de Jag N2EP

333. Re: Hypothetical lunar transponder

Newsgroup: rec.radio.amateur.space

OK, here's another possibility--
How about placement on one of the lunar poles. THis would allow for virtually continous sunlight on one side of the unit and radiation cooling off of the backside. Since there is no atmosphere, there would be no sunlight attenuation as we see on our poles from the low sun angle. The unit would need some all terrain motion capability to set up in the best position.
This could be fun.

RS-10 is dead so you wont hear it. After it's demise, the mode of operation for RS-12 was changed from mode K to KA where either 21 mhz or 145 mhz uplink frequency can be used.

Increase power, change your coax, change your antenna. When RS-10 was up using mode A, I usually operated with 150 watts to 0 db gain antenna. I have heard my signal with power as low as 50 watts.

You mention the 8 db vertical. If it really has that much gain it is achieving it by concentrating your signal at low elevation angles. You need gain at higher angles (like overhead) for satellite work, unless the sattelite you are interested in near the horizon.

336. Re: equipment

Newsgroup: rec.radio.amateur.space
Date: 1998-02-07 00:00:00 UTC
From: Bruce Nolte <brucenol@abs.net>
Message-ID: <34DC618B.5A712CE7@abs.net>
Source record: 16958

I would start out by talking to some other hams to get an idea about the kind of operating you want to do. A good place to meet them is at a local hamfest or Field Day setup. Assuming you will start by getting a no-code Technician license, and you do not live in a remote mountain valley, I would start with some 2 meter equipment. The great majority of active hams, from the greenest Technician, to the old timer who built his own tube powered rig in the 30's, to the guy with the 100 foot tower with 17 antennas on it have some capability on 2 meters. Equipment requirements are modest, you can start with a handheld 2 meter rig that can be purchased used for less than $200, and thanks to repeaters, you will be able to extend the range of your handheld far beyond what it would be talking directly to someone else.
Here in Baltimore, there are over a dozen machines that cover the whole metropolitan area, so there are plenty of people to talk to. If you can afford it, I would think about investing in a mobile rig, which can be used as a base station with a 12 volt supply and an outside vertical antenna. A setup such as this will give you better access to local repeaters, and will let you work more distant repeaters, as well as be able to make more direct contacts. If you can't afford a mobile rig, a vertical antenna, such as a Ringo Ranger will help extend the range of your HT. Unless you are skilled at electronic repairs, etc. I would stick with fairly modern, but not necessarily new equipment.

These quick suggestions will get you started, and only scratch the surface of the possibilities of ham radio. Once you get on the air, you will be able to tap into a wealth of knowledge and opinions concerning which direction you should take.
Good Luck and 73

Bill is a nice fellow and I, for one, am very happy to have obtained three of these converters shipped Priority Mail for my personal check of $100.

Radio Meteor Observation Bulletin No. 54 February 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Barcelona, Spain (01 59' E, 41 21' N)
Frequency: 48.250 MHz
Transmitter location: most likely Czech television C2 C. Budejovica,
100 kW, horizontal polarisation.
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
Antenna: astronomical azimuth 215 deg (=NE), elevation 0 deg.
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (100 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT and
"Data Capture" software with 9 second/18 sampling interval to
store all the > 1.0 s signal increases.

. data loss from Jan 25 onwards due to electricity fault
. observed Quadrantids maximum on Jan 3, 12-15h UT

Enric Fraile Algeciras

Observer: Eisse Pieter (Peter) Bus
Location: Groningen, Netherlands (6 deg 33' E, 53 deg 13' N)
Frequency: 72.11 MHz
Transmitter Location: Wroclaw, Poland, 130 kW, Distance 740 km
Antenna: Yagi, 3 elements, geographical azimuth 106 deg (ESE),
elevation 13 deg
Receiver: Bearcat UBC 860 XLT Scanning Radio, sensitivity: 0.5 uV
Observing method: Listening and counting in 5-minute intervals.

Mean "sporadic" activity on Jan 15/16 1998 during one hour starting at UT:

"Hale-Boppids" ?? Bootids

```
-----------------------------------------------------------
23h 0h 1h 2h 18h25m 19h 20h 21h
-----------------------------------------------------------
100 116 140 152 46@ 71 94 -
-----------------------------------------------------------
```

Activity on Jan 2/3 1998 during one hour starting at UT:

```
-----------------------------------------------------------
23h 0h 1h 2h 18h25m 19h 20h 21h
-----------------------------------------------------------
113 156 149 161 152@ 106 88 107
-----------------------------------------------------------
```

Notes:
. @ hourly rate extrapolated
. higher activity more than three sigma's above "sporadic" average is
only observed in the hour before the Earth crossed the orbital plane
of Comet Hale-Bopp around 1h UT on January 3.

Peter Bus

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00

66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 deg (= E),
elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

January 1998
Quadrantids

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Maurice De Meyere

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Will Kelsey

Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 3 element Yagi, direction south, elevation 65 deg
Receiver: IC-706 at 53.76060 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km,
direction south 2) a 30 kW TV video carrier from Sicilia,
Italy, distance 900 km, south. Both transmitters are processed
within the same 40 Hz virtual receiver channel.
Observing method: automatic setup using FFTDSP42t software by AF9Y to record
the audio signal. 20 channels of 2 Hz width are used for meteor

identification, pictures with interference, sporadic-E, E-layer
and FAI propagation are manually rejected.

All meteor counts below are corrected for a full hour observing time. If
the recording duration is 20-40 minutes, a dot is shown after the value.
Data for less than 20 minutes observing time are not shown here.

Counts of reflections longer than 6.5 seconds: assumed to be overdense.

| Dec 1997
```

Notes:
. blank value means either few or no data available or interference.
There was no sporadic-E and no FAI propagation during Dec 1-26.
. Dec 13 and 14: Geminids meteor shower.
. Dec 22: Ursids meteor shower.
. Data from Dec 1 - 8 are available on request, but quite normal act.
. local time conversion: 1 hour ahead of UT (05h00 UTC is 06h00 local).

Werfried Kuneth

Observer : Kimio Maegawa JA9BOH

Transmitter : HAM beacon (JA6YBR) (50 W Morse coded, 50.017 MHz) by
Miyazaki-University Ham Club.
Antenna: 1 lambda crossed loop, Az Omnidirectional 20 m H
Location: Miyazaki city (131.43E, 31.82N) NE-SW path 650km
Receiver : FT655 with 600Hz IF filter
Sensitivity: -150 dBm or lower, detect 3 dB galaxy noise variation
Location: Ohno Observatory, Japan (136.5E, 36.0N) 180m ASL
Antenna: 8 element Yagi(12dBi) 12m above the ground with no elevation.
Observing method:Automatic Duty Cycle measurement every minute by Audimate
software by Mr. Mallama of AMS above -130 dBm threshold.

Notes:
. Duty Cycle Graph for Quadrantids 1998 can be found at
http://www.fukui-nct.ac.jp/~kmaegawa/hro/98quada.html
. Quadrantids peak occurred at around 06 to 08 JST on Jan 4.
(21h UT to 23h UT on Jan 3 1998) based on my observation.
The activity was better than those of Geminids and equal to Perseids
maximum on Aug 13, 1996.
. local time = JST = UT + 9 hours

Cross-posted to: rec.radio.amateur.space,rec.radio.shortwave,rec.radio.scanner

Hello all,
I have recently gotten the bug to view weather satellite data as well as SSTV pics. I am looking for some advice. I have an ICOM R7000 receiver, a BC895XLT, R/S discone ant. (discontinued one) and a telescoping antennea. I want to know the best antenna that would enable me to hear these transmissions. Do I need a steerable hi-gain antenea and a preamp? Do I need another receiver? I have tried to find the data transmissions, but no luck. I found many s/w packages and have downloaded them for evaluation, but I need the received data to try them. Any help would be appreciated, especially the appropriate freqs.
Thanks,
Eddiek

If you want to communicate outside your local area and you funds are very limited, i would strongly suggest trying to learn Morse Code. If you can, then you can build your own QRP equipment and talk all over the States on a good day, and perhaps well beyond. That you can do for well under $100 and learn alot by doing such. 5 WPM is not that hard to learn for most people, and the important thing is to practice daily. But, as you know, you don't have to learn CW to get a license these days. However, the equipment needed to talk long distances with a Technician License can get pretty expensive. But you can talk up to a few hundred miles without learning the code from the right location with surplus equipment and homebrew antennas. And you can also have a great time with the equipment described in a previous posting.

But give CW a try first, as you can talk to the world on a very limited income if you are willing to put in that effort and to build your own equipment.

Eddie, why not try the HF fax first? It includes both weather charts
and satellite imagery. Your R7000 should work well with a wire antenna
(discone probably not enough), no preamp needed.
Go to: http://ourworld.compuserve.com/homepages/HFFAX/hf-fax.htm
for info, freqs, and such.
I used to use Navy NAM (Norfolk) while stateside. Big strong signal!
If you like it, and then want to try the weather satellites, that site
has information about that also.
For APT (low res data from the NOAA and Russian polar orbiters), if your
R7000 has a 40KHz bandpass selection (somewhat wider than narrow FM, yet
much narrower than wide FM) you could use that. Otherwise you might
have to get a specialized wefax receiver. A pre-amp might be required
depending on antenna gain and line loss.
If you go beyond APT, there are the GOES (geostationary) and NOAA AVHRR
(orbiter) ground stations that can be built. That is way beyond most
hobbyists means, but doable with the right amount of scrounging and
money. The fun part is using digital imaging techniques to bring out
nuances in the cloud/vapor data, or water bodies or vegetation.
What do you do at NRL? I am a former AF wxman, and used to work with
the Navy at JTWC/Nimitz Hill. I'm good at remote sensing and GIS, but
presently working hydrology for the Army corps of engineers.
Good luck,
Brian/N0iMD

343. STP tracking program for DOS.

Newsgroup: rec.radio.amateur.space
Date: 1998-02-08 00:00:00 UTC
From: bd703@scn.org
Message-ID: <Eo1Cwx.CDw@scn.org>

Has anyone else tried the STP program available for downloading
from Amsat?

I've got a 10 yr old PC clone that can't run modern tracking programs
like STSPLUS so I decided to try STP.

I have finally got it set up so ALMOST all the functions work properly.

The one thing that won't work right is the "Real Time Mutual Tracking"
(option "M"). The "m" option to generate "Mutual" tables works just fine.

Has anyone else had simular problems?

You can get reasonably current keps and other sat info from the Amsat
home page.

http://www.amsat.org/

There is info on how to subscribe to the keps mail server also.

Mark,

I think the KR-10 was made by the same people that make
Kanas City Tracker. Either way I don't think it's available
any more so you may have to track one down on the secondhand
market.

You may instead want to have a look at MacDoppler that
can control the Yaesu rotors. Have a look at,

http://www.interlog.com/~dogpark/Macintosh_Amateur_Radio_Pr.html

The author is still working on this programme so you never
know if you ask nicely he might include your rotor in
the programme.

Hope this helps,

Sean.

For more Mac / Ham / SWL software have a look at,

Once a month I post a summary of weather satellite operations in this
group - see a few messages above!

You can 'hear' the wxsats in the 137MHz band using almost any antenna.
For decoding you will need a proper wxsat antenna which can be fixed -
no tracking is needed. A scanner tuned to 137.85MHz, 137.50MHz and
137.62MHz will regularly hear the wxsats go over.

For more info, visit one of the many wxsat sites.

When rec.radio.amateur.space was chartered many years ago, one could count on 5-10 articles being posted each day in the fledgling newsgroup, and 25-30 articles being posted on rec.radio.swap, thus making it practical to subscribe to both newsgroups in order to find on-topic subjects. Such is no longer the case, and the charter that prohibits 'for-sale' postings doesn't reflect the realities of today's newsgroup paradigm.

I would much rather encourage a newsgroup advertiser to post responsibly (low frequency of on-target posts, no spams (which I define as multiple postings of the same or near same message, which was certainly NOT the case here), and a willingness to move the nitty-gritty of commerce off the newsgroup and into email. I would ask that you consider doing the same!

Of course.. when r.r.s was chartered, you didn't see people hiding behind cute "handles" such as "captain crude" either. Hmmmmm

Actually, "tele" is the Greek for "distant". Like "tele-phone" = sound from a distance. There's no link with "transportation", really.

Not that it matters THAT much. :-)

is a possibility. I've ocasionally thought that space would be a good place
to revisit the vacuum tube.

It's called cold-cathode vacuum microelectronics and yes, it's being considered for high-rad environments. Basically, you have a pit etched in the silicon substrate (a micron or two in diameter) with a needle sticking up from the bottom, center. The needle's point is an atom or two in diameter. The needle is the cathode, on the surface of the substrate, surrounding the hole, is the grid, and an anode is layed over the top. With a relatively modest voltage on the needle, say 50V or so, the electric field intensity (which is proportional to the surface curvature) is so intense at the tip of the needle that electrons are ripped off. After that, it's a classic vacuum tube. Currently they are being used mainly in flat-panel displays (Field Emission Displays).

As I recall, they were getting about 4 kV at about 1 amp
before the tether failed. The theory supporting tether
generation is sound. The practical questions about
deployment and the end terminals have yet to be
satisfactorilly addressed. But I'm confident that they
can be.

As usual, you have succinctly identified the problem with mechancially
scanned sensors. Their application really has to be limited to well illuminated
bodies with a high reflectance. Of course there's a tradeoff between those
two things. For example, the Moon has a low refectance, only about 4%,
but it is very well illuminated by sunlight so it appears bright. At greater
distances from the Sun, objects have to have a higher reflectance to be
seen as clearly.

Except you wouldn't need the tube. Which is good, because it would probably burst. If you don't fire it up until it's in orbit, will the grids survive launch?

> This could be fun.

While there may quite well be some deep craters on the poles into
which the sun never shines (and some speculate that there might even
be water from some comet impacts), it can be quite hard to find a
mountain top at which the sun always shines.

I have not seen any figures for the tilt of the lunar axis relative to
the orbital plane, but apparently (from visual observations) it is
perpendicular to the orbital plane (apparently due to the synchronous
rotation).

However, the lunar orbital plane is tilted 5.5 degrees relative to the
ecliptic plane (the orbital plane of the earth). Due to this tilt, we
only get solar and lunar eclipses quite rarely (not every fortnight).
The moon can be up to 5.5 degrees above resp. below the ecliptic plane
as seen from the earth (the center of the lunar orbital plane) during
a fortnight. Assuming that the lunar axis is perpendicular to the
lunar plane and observing from the lunar pole, the elevation of the
sun can vary from -5.5 resp. +5.5 during a fortnight in the worst case
(when the largest deviation from the ecliptic plane occurs during new
moon or full moon. During the "eclipse season", the sun remains close
to the horizon, since the largest deviation from the ecliptic plane
occurs at 1st and 4th quarter.

To be constantly in sun light, the station must have unobstructed view
5.5 degrees _below_ the horizontal plane. If the station is at lunar
north pole and has free view only to the local horizontal plane, only
half of the earth will be visible. To be able to fully illuminate the
whole hemisphere of the earth, free view towards the earth at least
one degree below the local horizontal plane is required. To account
for the Fresnell zones and the associate signal losses and multipath
problems, a larger clearance is required particularly at lower
frequencies (VHF/UHF).

Unless you can find a mountain top which is 5 km higher than any other
mountain tops within 150 km, the top will not be constantly lit. While
theoretically, the poles seem to be nice places for the station, in

practice finding a suitable mountain or erecting high towers makes the alternative less interesting.

A simpler solution would be to use two transponders, both on the equator, one close to the western limb and the other near the eastern limb of the moon, with a total of about three weeks of operation time each month. The operation would be interrupted only for a few days during new moon.

If plenty of battery power would be available, the other station could operate a few days after sun set and the other would start operating a few days before sun raise (with energy collected the previous day), a constant coverage could be maintained. It is easier to store power for the transmitters for only a few days than to store sufficient power for two full weeks.

You need to purchase a book titled 'Weather Satellite Handbook' by
Ralph Taggart. This book explains everything you need to know about receiving
weather satellites. The book is available from the ARRL. They have a website
located at:

http://www.arrl.org/index.html

My brother is a Capt. in artillary, and I asked about this when I was
thinking about "blasting" a small package into orbit. Those shells
only have a 900-1100 ft/s muzzle velocity. Considering the barrel length,
that's actually a fairly low rate of acceleration.

Hey! The Russians used those dinky little tubes on their space stuff
untill the mid 70's. Ask _them_ for data!

is published every week and is made available for non-commercial use.

* BELIZE OPERATION IN MARCH *
============================
Frank Edwards, VE3ER, reports that he will be active on RS-12 from Cayei
Caulker, Belize, from 03-Mar-98 to 16-Mar-98. His callsign will be V31FE,
and he will be operating CW around 29.415 MHz and SSB around 29.440 MHz.

* MIR AMATEUR RADIO STATUS *
============================
Mir Amateur Radio Status Feb 5, 1998

The cutoff date for submitting Sputnik-40 reception reports is 28-Feb-98.
Please send reports to:

Sergej Samburov
PO Box 73
Korolev-10 City
Moscow Area, 141070, Russia

The FR5KJ Radio Club is also providing a Sputnik-40 diploma in return
for reception reports. Their address is:

FR5KJ Radio Club
College Jules Reydellet
103 rue de la Republique
97 489 Saint Denis Cedex
Reunion Island.

The current Mir crew consists of Commander Anatoly Solovyev, Flight Engineer
Pavel Vinogradov, Talgat Musabayev RO3FT, Nikolai Budarin, RV3DB and R4MIR,
American Andy Thomas, KD5CHF, and Frenchman Leopold Eyharts, who is aboard
Mir for a 3 week stay. The next shuttle docking mission is currently
scheduled for 28-May-98.

The Mir packet radio PMS and the SAFEX II repeater are both currently turned off for the time being. The Mir crew has just been too busy with other higher priority projects to spend much time adjusting parameters on the TNC. The Mir crew has information required to reconfigure the new TNC, and we are just waiting for the crew to find an open slot in their schedule to load in the correct parameters.

While the Amateur Radio Station on Mir has been turned off, the crew may still turn it back on to make random contacts with groundstations. MIREX was informed by MAREX that the Mir crew is expected to be very busy until after crew 24 returns to earth.

MIREX would like the stations monitoring the PMS to please be patient while proper adjustments are made to the packet radio terminal node controller.

MIREX has created an Internet Web page containing information regarding Mir and the various Amateur Radio experiments proposed for the space station. The pages are still "under construction", but some good information can be gathered from what has been put together so far. URLs include the following:

http://www.ik1sld.org/mirex.htm OR
http://www.ik1sld.org/mirex

http://www.geocities.com/~ik1sld/mirex.htm OR
http://www.geocities.com/~ik1sld/mirex

Some people have had problems using the some of the URL aliases, if so, try the long version of the home page address:

http://www.geocities.com/CapeCanaveral/Lab/3431/mirex.htm

[Info via Miles, WF1F, MIREX Director of Educational Resources]

* VK0MAP ACTIVE FROM ANTARCTICA *
==========
Andre Phillips, VK0MAP/VK5AAP/ZL3AW has been active on KITSAT-OSCAR-25 from Antarctica. Andre is using a Kenwood TS-790A along with a PacComm Tiny 2 terminal node controller and a pair of Lindenblad antennas constructed from number 8 fencing wire. He reports at least 5 minutes of solid connect time per pass on KO-25, and mentions that UO-22, KO-25 and POSAT all rise to an elevation of 34 degress, and KO-23 gets as high as 12 degrees at his location.

361. Keplerian data for Ham satellites?

Newsgroup: rec.radio.amateur.space
Date: 1998-02-09 00:00:00 UTC
From: Hmmm <test@aol.com>
Message-ID: <34E00642.45A919B4@aol.com>
Source record: 16887

Once upon a time, before I worked endless days...weeks and Months.... I used to operate on the ham satellites.... well work is finally tapering off somewhat. What I need to know is... where did I used to d/l the keplerian data for the amateur satellites. All I remember is that I could d/l one file and it had all commercial and amateur satellite info. I just cant remember where. Dejanews has not been any help.

Can anyone help out, or am I really as insane as I think I am?

73,

Joe Sands W7UV

Proximity fuses on WW II antiaircraft artillery shells used tubes;
launch shouldn't much of a problem.

364. RE: Ham-Space Digest V98 #44

Source record: 16980

I am trying to setup a satellite HAM radio station. I have acquired a used antenna system and I am not sure what works and what doesn't work. I have been trying to receive AO-10 since it fairly stationary during parts of the day over my location in Florida. I have not been able to receive anything yet. Here are a few questions.

1) The antennas have switchable polarization. How do I find out what polarization should I use?

2) Is AO-10 very active and on what specific frequencies?

3) The rotator is a Yaseu but the KC Tracker had died and the prevoius owner threw it away or lost it. Where can I get a replacement (other than Yaseu's)?

4) One of the preamps requires 12 Vdc on the coax itself for power. How do I add this without damaging the receiver?

Thanks for your time and help in advance.

Tom Stiles

>radioastronomy dish or satellite dish, to make them smaller?
>Regards,
> Ian
>(I'm referring to the issue dated 31 january 1998, page 28 "Aerial Magic")

Yes. You can make dishes smaller. This works most dramatically for dishes that are only a few wavelengths in size though. For dishes of about 20 waves or greater in diameter fractalization is not electrically advantageous, and mechanically disadvantageous.

An alternative approach is to drop the dish entirely. An array of fractalized helices will fit in a form factor a fraction the size of a dish for a given gain. Bandwidth about 20%.

I am a radio astronomer. I am working on 'radio camera' arrays using fractals.

366. NORAD Two-Line Orbital Element Sets (TLE140)

Newsgroup: rec.radio.amateur.space
Date: 1998-02-10 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <6bodiv$1q7$1@blackbird.afit.af.mil>
Source record: 16889

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial WWW:

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

367. Re: Keplerian data for Ham satellites?

Newsgroup: rec.radio.amateur.space
Date: 1998-02-10 00:00:00 UTC
From: Roberto <roberto@netwide.net>
Message-ID: <6bq5s3ibo1@news9.ispnews.com>
Source record: 16890

Joe,

There are several sites where you can find the data you need (divided into categories). Here's two of them:

http://www.logsat.com/keps.htm

http://www.grove.net/~tkelso/NORAD/elements

73s,

Roberto ik8sqi
Hmmm wrote in message <34E00642.45A919B4@aol.com>...
Once upon a time, before I worked endless days...weeks and Months.... I used to operate on the ham satellites.... well work is finally tapering off somewhat. What I need to know is... where did I used to d/l the keplerian data for the amateur satellites. All I remember is that I could d/l one file and it had all commercial and amateur satellite info. I just cant remember where. Dejanews has not been any help.

Can anyone help out, or am I really as insane as I think I am?

73,

Joe Sands W7UV

Tsinghua University Amateur Radio Club, Beijing, China

* * * * * * * * * * * * * * * *

BY1QH RESULTS ON 144 MHz EME, SATURDAY, FEBRUARY 7

SUMMARY:

RX and TX performance much better than expected!
Got QRV 45 minutes later than planned. SRI!
Very low local QRM all the time!!! UFB WX.
WKD I2FAK SM2CEW PE1LCH PA2CHR HRD 9H1CD,
Sked 1600-1630 continued until 1728.
PA died at 1900.
We detected only 2-3 unidentified callers.
Seemed like very few called us.....?
Very satisfied any way!

DETAILS:
P=Planned activity
H=This is what happened
UTC
P 1130-1230 EME random.
H 1215-1230 EME random. SRI ABT late QRV!!
P 1230-1300 TEP sked SSB 144.136 MHz with VK6XLR
H 1230-1300 TEP sked. NIL HRD in both directions.
P 1300-1330 EME sked with PE1LCH, PA2CHR tail end. QRG unknown
H 1300-1330 EME sked with PE1LCH. Too weak signals to copy.
P 1330-1600 EME random
H 1330-1600 EME random. WKD I2FAK 1356.
Called 9H1CD 1443-1518, NC.
WKD SM2CEW 1552.
P 1600-1630 EME sked with PE1LCH, PA2CHR tail end. QRG unknown
H 1600-1728 EME sked with PE1LCH, PA2CHR tail end.
The signals were improving all the time, so we kept
on going. At 1700 we just needed the "Q" in our
call sign. Completed with PE1LCH at 1711.
Completed with PA2CHR at 1728.
P 1630-1800 EME random. From 1700 our local QRM is less bad!
H 1730-1900 EME random. From about 1814 there was an
unidentified station calling, possibly sending:

R, N, 52, B, U, and L ...? At about the PA
died....QRT
P 1800-1830 EME sked with PA2CHR. QRG unknown NW.
P 1830-2035 EME random

P 2130-2230 CQ DX 1827 kHz +/- QRM, 400 W & dipole at 30 magl
H 2140-2235 CQ 1827 kHz/1826.6 kHz, QSX 1829. WKD only BV and
YC.

COMMENTS:

VY SRI ABT getting QRV 45 minutes late! Some preparations took
longer than expected.

The local QRM level was so low that we had to make sure several
times that the pre-amp was OK....! UFB! I even switched on the
built in pre-amp in the IC-706. The Chinese new year is VY
important in BY. The university was on holidays, so we guess all
local QRM sources were switched off. Even the paging transmitters
seemed to affect us less than expected, even in daytime.
We were VY happy and encouraged by being able to work "average
size" PE1LCH and hear 9H1CD, after having to struggle with big
guns like KB8RQ, W5UN and VE7BQH.

We got the impression that few stations were QRV since PA2CHR
reported good signals from us during our QSO, also we think I2FAK
called us a 2nd time giving us 529 report, and SM2CEW seemed to
have had a very solid copy of us. He also found our sked QRG
144.120 MHz easily. We even made a few phone calls to SM to try to
stir up some activity, but soon the PA died!! Thanks any way to
SM4SJY who we think made several phone calls for us.

Especially happy about being able to work PE1LCH and PA2CHR who
both contributed with VY important equipment to BY1QH!!! (It is
just too bad that we could not give both of you a "first"!)
Too bad about the new PA going QRT! We really hope we can repair
it. The old PA is still in BY, but it was not in the shack, so we
could not switch.

Next activity is not yet planned, but it is likely to take place
within 3-6 weeks.

Pictures, sound file, log, and other info ABT BY1QH can be found
on: http://www.horizon.nl/~tdekkers/by1qh/index.html
The BY1QH home page is made and hosted by PA3DSS.

Station improvements since 1997 are:
Improved elevation readout at low elevation angles
New RX filter 250 Hz (500 Hz B4), and new PA (presently QRT)

Other equipment same as before:
IC-706 Mk2
SSB electronics pre-amp 0.8 dB NF in mast head

4x9 el Vargarda, total gain 17.7 dB
Stacking loss 0.5 dB, feeder loss 0.7 dB

QTH: LOC ON80DA
Tsinghua University in Beijing

ZCZC AX01
QST de W1AW
Special Bulletin 1 ARLX001
>From ARRL Headquarters
Newington CT February 10, 1998
To all radio amateurs

SB SPCL ARL ARLX001
ARLX001 AMSAT News Service editor BJ Arts, WT0N, SK

AMSAT News Service Bulletin Editor Bernard J. ''BJ''
Arts, WT0N, of Hibbing, Minnesota, died unexpectedly
on February 9, 1998. He was 37.

Arts took over the handling of the weekly AMSAT a couple of years ago, according to AMSAT-NA President Bill Tynan, W3XO.

Tynan expressed shock at Arts' untimely passing. ''He certainly was a big help to AMSAT,'' he said. ''He will be missed by all of his friends around the world.''

According to fellow club member Gregg Mihelich, AA0DX, Arts was hospitalized after complaining of flu-like symptoms and died a short time later.

Arts was an active VHFer and satellite op. A broadcaster, he had been employed at WDIO-TV in Duluth, Minnesota, and at KSTP-TV in Minneapolis, where he'd won an Emmy Award. He also worked as an announcer on WMFG radio in Hibbing.

BJ Arts was a life member of the ARRL and was president of the Midrange Amateur Radio Club. He also was an Assistant Emergency Coordinator in Northern St Louis County and a Skywarn volunteer. He was also active in Army MARS as AAR5EL.

Survivors include his mother an a sister. Services will be 11 AM February 11 at Blessed Sacrament Catholic Church in Hibbing.

371. Information on 1.7Ghz feed needed ! (can I use the MAF-1700 to receive LOW Orbiting Sat's like Noaa's) ??????????

Newsgroup: rec.radio.amateur.space
Date: 1998-02-11 00:00:00 UTC
From: Geert PIRENS <pass@glo.be>
Message-ID: <6bsttmqma1@rhea.glo.be>
Source record: 16894
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.space,uk.radio.amateur

Hello,

I have buy me yesterday the MAF-1700 from Orbit Electronics a MTEOSAT active feed with LNB
the specifications are:

Input 1690 to 1710 Mhz
Output 133 to 153 Mhz
Gain > 60dB
Nf < 0.8dB

I was thinking about myself and wondering if I can use it for tracking low orbiting satellites like NOAA's.
Becourse the converting is like this:

Input freq. output freq.
1691 = 134 Mhz For Meteosat
1694,5 = 137,5 Mhz For Meteosat
1698 = 141 Mhz For Noaa (hrpt)
1707 = 150 Mhz For Noaa (hrpt)

Theoretical it likes to be working for me, what do you think ?

Who can help me out of these problem ?

!!!! ALL INFORMATION IS WELCOME !!!!

Thanks to all you smart people !

With Kind Regards

Geert Pirens

The major G force suffered by any rifled projectile is due to the spin.
For example, a .30 cal rifle bullet spins at 200,000 RPM. Artillery shells
spin much more slowly, but the G force is still over 1,000 Gs at the
skin of a 6 inch artillery shell. The WWII proximity fuses used planar
tubes mounted aligned with the projectile spin axis to minimize the
effects of differential G on the tube internals.

Hello you all.

I am building me a receiver till I saw that I can get the COILS nowhere !!

Does anyboby can tell me where to buy these coils or HOW TO MAKE THESE COILS
AT MY SELF ?

These are the coils I need:

L1 - 4.75T 0.7mm ECW TAP 1.25T
L2 - 4.75T 0.7mm ECW CT
L3 - 4.75T 0.7mm ECW CT
L4 - 4.75T 0.7mm ECW
L5 - 10.75T 0.4mm ECW
L6 - 4.5T 0.7mm ECW CT
L7 - 4.75T 0.7mm ECW TAP 1.25T
CH1 - 3T 0.4mm Ferrite Bead.
CH2 - 3T 0.4mm Ferrite Bead.
T1 - 20T pri. / 5T sec.

All coils 5mm NEOSID F29 Slug.
0.7mm Coils spaced 1 wire dia.

I dont understand the above so who can tell me more about the above
information ?
I was wondering whats the meaning about this ECW, SLUG, TAP, etc..
Who can fill in these questions ?

ECW TAP ?
ECW CT ?
ECW ?
Ferrite Bead ?
NEOSID ?
F29 Slug ?

I thank the peopele who response me !

With Kind Regards.

ECW - Enamel Coated Wire
TAP - A tap on the coil 1,25 turns from one end.
Ferrite Bead - A premade cylinder of powdered iron with a hole through it.
NEOSID - got me.
CT - Center Tap
Slug - A preformed powdered iron material with threads that screws into the
coil to adjust its inductance

Dave

Dear Geert,

I vaguely remember Neosid was the name of a coil manufacturer.
Could be wrong.

But to design single-layer coils given the number of turns, wire gauge, diameter of former, winding length, or the other way about by experimentation, for a required inductance, or to resonate with a given capacitance, or, or, or, etc. Download "SOLENOID.exe" program from my website in 10 seconds. Not zipped up. Free takeaway. No catch. Can be used immediately.

Will cater for antenna loading coils, big trans-match coils, and tiny little things at 145 MHz.

Generally speaking, having designed a coil using the program, its inductance can be increased by, crudely, up to 40 percent by inserting a small iron dust or ferrite slug. But you will need internally threaded coil formers.

Regards, Reg.

Hello--
"Neosid" maye be either a British or other European manufacturer's trade
name for an inductor family (like "Miniductor").
73,
Brad AA1IP

>vissit my multi interests homepage at:
>-> http://user.glo.be/~pass <-

I've built my own Noaa hrpt receiver, and tracking noaa hrpt signals in
the way you suggest was my starting point.

Feed the output of your downconverter into any vhf radio / scanner
capable of receiving ssb, and wait for a pass. Watch out for the doppler
of +/- 50 khz on an overhead pass. Your Meteosat feed should pick up a
strong signal from any of the noaa's.

If you know when a pass is due, fine, but if you don't, perhaps the
easiest way is to tune the vhf rx to 137.62 Mhz narrow FM and listen out
from local noon onwards. A 2M dipole works fine. Sometime within 1h 40m

you'll hear the distinctive clip-clop of the APT signal from the satellite. Quickly plug in your downconverter, tune the rx to 150 Mhz and listen around on ssb for the hrpt carrier. Use 100 hz steps if you can, and you'll soon find it. The pass lasts about 10 minutes and has severe doppler, so don't hang about!

If you're interested in wxsats, I suggest you join the Remote Imaging Group. They have a Web page at http://www.rig.org.uk

BTW don't expect anything more from the hrpt carrier than a whistle. To receive pictures you need a steerable (az-el) 1m dish with ideally a circular polarised feed, a phase discriminator receiver with about 5 Mhz bandwidth, and the software / hardware for your pc. Great fun to get going, and some stunning pictures.

Brian,

If you are looking for an interface you can build, I know FODtrack is an easy one. Anyhow check AmSAT web page for downloadable soft, there you will find this one among others.
AmSAT also have a list of sat equippment suppliers where you can purchase a working one. I don't know if TrackBox is easy to find built but KCT can be bought from many suppliers.

Good luck!

We have written a Toroid software package for use DC to 300 Mhz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining cusom phenolic cores from plastic, teflon, wood, ect...
Download a demo or just view the software main screen at our web

Hi,
I am looking for any information what is the data format
of the data feed transmited on some FM stations and
cable and satelite channels (CNBC and on Galaxy V satellite,
transponder 13, C-SPAN I and on SatCom C3 satellite,
transponder 7, AMC and SatCom C4, transponder 1, WGN and on
Galaxy V, transponder 7, New York WPAT 93.1 and WLTW 106.7,
many other stations).
It suppose to be DBC stock market real time data feed
coded into subcurrier different then 38kHz. I was not able
to find anything on the Web (did not know what to search for).

Thanks

Michael

I haven't been on the satilites in 4 or 5 years. There was a filter that is used for your problem. I think it was probably a low pass filter on the two meter transciever with a cutoff frequency of about 148 to 150 mhz to supress the 3 rd harmonic of the 2 meter uplink signal (3 x 145 = 435 mhz). 435 mhz should be your downlink frequency. You need to contact AMSAT for some help.

The device you describe is a "Bias Tee", typically they are built for a particular freq range but whatever design you have is probably good for anything below 1 GHZ. You put one at the 12vdc feed end (your power supply) and the other at the top of the mast to feed a switch or preamp.

DC Input From Power supply DC Out to preamp

Source record: 16835

Matt:
I have built some circuits as you describe and found that component values are not at all critical. You just have to ensure that the RF power you use can be handled by the capacitor while not attenuating it (Xc<<50ohm). Don't know the freq. range you need but for VHF/UHF a 0.01uF 1KV disc will be fine. The inductor must handle the converters supply current so there you've got some data, also it must highly attenuate the RF so Xl>>50 (i.e. 40uH).

Good luck,

73 de CX6DD

407. NORAD Two-Line Orbital Element Sets (TLE145)

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial WWW:

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

409. Using satellite telemetry in schools

Newsgroup: rec.radio.amateur.space
Date: 1998-02-18 00:00:00 UTC
From: steve.NIchols@paston.co.UK
Message-ID: <34EAE5A2.E26@paston.co.uk>
Source record: 16929

I am currently researching a project on the use of satellite telemetry
in
the classroom. If anyone is using UoSAT B, Dove or other data in
secondary/high school lessons I would like to hear from you.

Steve Nichols G0KYA

410. 12vdc bias on feedline

Newsgroup: rec.radio.amateur.space
Date: 1998-02-18 00:00:00 UTC
From: mgilbert@csi.compuserve.com
Message-ID: <uRObfpIP9GA.197@nih2naaa.prod2.compuserve.com>
Source record: 16930

This seems like the place to post this since
we do this stuff all the time.

I want to put 12vdc on my coax line and send
it up to a downconverter. My question is how
do I get the 12vdc on the line and then back
off. I have a schematic of a cap and coil
that appear to do it - the cap appears to
keep the 12vdc from getting into the RF
side of the device and you tap the 12vdc
off the coil, but the values of these
devices don't seem to make any sense to
me - the circuit looks like a standard
high-pass filter, but the resonance
of the cap-inductor doesn't match what
I would have expected. So in a nutshell:

1. how do I get the 12vdc on the line
what is the circuit and how do I calc
the values.

2. how do I get the 12vdc back off at
the device end, I think I know the
circuit but don't know how to calc
the values.

Thanks,
Matt Gilbert
KC8FAY

(the sad thing is, this is something I probably
learned studying for the advanced ticket, which
I just passed last weekend - oh well, to much
theory not enough hands on - but I'm trying)

I am looking to try out the satelites, but only have a 2 meter FM rig and a Bearcat scanner for receiving 440 signals. Is this possible and if so How? Freq? Uplink Freq? Downlink Freq? Please send comments to kb2sin@aol.com
Thank You

Matt,

My experience has been that the 100watts from my Icom 271-H (actually getting about 50 watts out after it travels through the coax to the turnstile) has been sufficient in all but the most difficult passes. In fact, the limiting factor has been my ability to receive the downlink, and not get a good uplink signal into the satellite. You'll probably find that a similar power level of 100watts into an in-the-clear Eggbeater will work just fine for you as well.

G'luck, and see you on RS-12!

Source record: 16837

Just because you have an inductor and capacitor in a circuit shouldn't imply that you desire the circuit to be resonate. I have to admit that I sometimes get off on a tangent myself.

The purpose of the capacitor is to block the DC voltage and pass your RF. The capacitor must be large enough as to not introduce any significant capacitance reactance or Equivalent Series Resistance (ESR) at the desired frequency. A ceramic chip capacitor is best, but a ceramic disc capacitor will work fine at frequencies up threw UHF. I don't believe a 0.01uF 1KV disc would be a good choice at VHF or UHF since the ESR may be a bit high (depending on the construction of the capacitor).

The purpose of the inductor is to block the RF from the power supply. In other words, it keeps the RF from being shorted out. The inductor must be large enough such that the inductive reactive is significantly higher than your feed line impedance at the lowest operating frequency. since the inter winding capacitance should be kept low, a single layer air core inductor works best.

The 2nd addition of the ARRL's "The Satellite Experimenter's Handbook" contains construction details of the circuit on page 9-11. The following is as copied from that publication. However, I would wind the coil with heavier wire so it could be self supporting and hold its shape better. If you use heavier wire you should increase the number of turns to keep the inductance up.
Jim
WD0DIA

28 MHz 146 MHz 435 MHz
L 20 H 1.5 uH 0.3 uH
C 1000 pF 500-1000 pF 200-1000 pF

The inductor value is not critical. It may vary from 0.5 to 2 times the value shown. You may use 15 turns of #32 enameled copper wire wound on a 0.1" ID with a turn spacing of one wire diameter.

I use RS12 regularly by uplinking on 15 meters with about 30 watts into a dipole. However, when it was in mode A (145 MHz up, 29 MHz down) a few months ago I did make a couple QSOs by keying CW with my FT-50RD (five watts) into 30 feet of RG-58 coax into a two meter dipole. Not the best VHF combination but I could hear my downlink fine.

I agree with Wayne that the important thing is being able to receive the downlink. You can judge that easily by monitoring the becon at 29.408 MHz.

415. Beacons

Newsgroup: rec.radio.amateur.space
Date: 1998-02-19 00:00:00 UTC
From: Joshua Rozovsky <JoshuaRozovsky@gwsinc.com>
Message-ID: <6cilf6gvj1@newstand01.iconnet.net>
Source record: 16839

Does anybody know where one can find schematics or kits of beacons which can be used for balloon operations or DFing (foxhunting). Can any of these beacons also identify themselves every 10m and give some sort of tone to make them easier to track than an unmodulated carrier.
73,
Joshua Rozovsky, N3YAR

416. S-Band reception with MMDS ant.

Newsgroup: rec.radio.amateur.space
Date: 1998-02-19 00:00:00 UTC
From: Fernando Mederos <fmederos@adinet.com.uy>

Source record: 16840

Hi all,
I was thinking of modifying one of those parabolic reflector
with
downconverter antennas for MMDS (2500-2686 MHz) to receive Ham
satellite's S-Band. From California Amplifier specs. seems that NF is
far from ideal. Some models have filters to reject our 2400MHz portion,
but what about those without filter? I remember some time ago a Ham
tried this out and described Cal.Amp.'s LO sinth. circuit (with
MC145151), but don't know his results.
If someone has experience on this please share...

Matt,
All the experts say to use the least amount of power necessary to be heard and concentrate on a good receive signal. I'm running about 28 watts into a vertical on the roof for RS-12 on mode A. My receive antenna is a 10m turnstile.

I've been working RS-12 for less than 2 months and the setup is working just fine.

Rather than trying to do everything in software why not try a mechanical
solution? Obtain a long, narrow piece of metal or a meter (yard) stick
with a known, accurate right angle at the end. Place the end in the belly
of the dish with the narrow dimension towards the center. If two "sticks"
are used the center of each will cross at the focus. If one is used,
then the center of various positions will locate a single point which again
is the focus. It seems reasonable that this should work for both circular
and off center focused dishes but the latter is going to be far more
difficult to do. Cliff Buttschardt K7RR

>f/D=0.35 D=2'

If by "standard dish" you mean a parabolic dish, there is only one
focal point, dictated by dish geometry, and it is the optimum feed
position. Any other point will compromise dish gain and off-axis
behavior. In the case of a f/D=0.35 and a 2 ft diameter, the optimum
feedpoint is on axis at a distance of 8.4 inches from the dish.

Dishes designed for offset feed are complex hyperbolic shapes,
though oval hyperbolic dishes can be approximated as complex
sections of two parabolas. Unless you know the generator parameters
for the surface geometry, the best way to determine the optimum
feedpoint is by experiment.

There is a program which may be useful. It is called HDLANT21 and
is available from the ARRL website at http://www.arrl.org/qexfiles/
It allows you to design horns, dishes, and lenses (HDL). It has a
section for calculating offset feeds for oval hyperbolic dishes.

Another suggestion. Get some aluminum tape and put squares of aluminum at a variety of places scattered around the inside surface of the dish. Take the dish outside on a sunny day and point it at the sun. Each of the little aluminum squares should act like a mirror and all the reflected rays will meet at a point above the dish. That is your focus. Measure the distance from the bottom of the dish to the focus so you know where to put your feed later.

I haven't tried this, but it should work...

How about a geometric solution?

If it's not an offset feed dish, all you need to measure is the diameter of the dish, and its depth. Then apply some high-school geometry (y**2 = 4ax) and you can read off any numbers you need. Measure the depth at several radii and do some curve fitting if you want better accuracy.

One suggestion that worked well when I helped my Dad refurbish a surplus dish for C band satellite tv - if it's not sagging too far, a heavy rope will sag in a parabolic arc. Handy for bashing the dents out. We embedded an old car rear end in a concrete foundation as the basis for the dish mount. Cheap, worked a treat, and survived 120+ kmh wind storms.

I have done it. 10 years ago IKEA K&#65533;chenlampe braun (brown lamp for
kitchen) was used by European amateurs on 10Gc/s ssb, but the applying
the abovementioned method showed that efficiency of this IKEA lamp dish
is dubious, the light appears on 3cm broad area on the rod, so gain was
only 25-26dB compared to similar size dish which has 30dB.....

434. Balloon Transmitters

Newsgroup: rec.radio.amateur.space
Date: 1998-02-22 00:00:00 UTC
From: Joshua Rozovsky <JoshuaRozovsky@gwsinc.com>
Message-ID: <6cq7v7jbm1@newstand01.iconnet.net>
Source record: 16858

I am currently organizing a balloon flight. The first flight will carry the required hardware (radar reflector, parachute, etc) and two small transmitters, one for 2m and the other for 28 MHz. I am going to use the PIC-based IDer (featured in January QST) to send the following in Morse code every 3 seconds at 20 WPM:
"N3YAR Balloon Beacon"
However, the IDer will only generate THAT message. I need to transmit it. If I could, I would like an alternating tone in between the 3-second messages. Something like "Hi-low, hi-low, hi-low" alternating tones. My question is, how does one design a transmitter for 28 MHz and 2m, and how do I make it send alternating tones, if that can be done. The IDer will act as a keyer for it.
Thanks & 73,
Joshua I Rozovsky, N3YAR

is published every week and is made available for non-commercial use.

* 70-cm SPECTRUM LOSS *
======================
In late January, the Telecommunications Authority in the country of Guatemala
auctioned off four frequencies between 430 MHz and 435 MHz for commercial
use, despite their use by amateur radio operators in that part of the world.
Amateurs in the region have been trying to convince authorities not to
auction spectrum that is shared by amateurs to commercial users for over
a year, but as is often the case, the money that could be gained through
such a frequency auction spoke much louder than reasonable arguments by
hams against the selling of spectrum rights to the highest bidder. Mexico
also recently lost UHF amateur band spectrum to commercial interests, and
this appears to be a disturbing trend.

Although the 430 MHz to 435 MHz spectrum loss in Guatemala does not directly
effect OSCAR satellite communications, a precedence has now been set, and
just as arguments against such an auction by amateur radio operators largely
fell on deaf ears, there is no guarantee that frequencies within the 435 MHz
to 438 MHz UHF amateur satellite sub-band will not be auctioned off to the
highest bidder in the future.

The implications of frequency auction involving spectrum used by OSCAR
satellites are staggering. While commercial interests buying rights to UHF
spectrum are primarily concerned with short-range communication services, it
is well known that even low-power transmissions can be relayed half a world
away via a transponder carried on-board a communication satellite in earth
orbit. Clearly, something needs to be done to prevent future spectrum grabs
that affect worldwide amateur satellite communications if OSCAR satellites
are to continue to utilize spectrum that is not exclusively allocated to the
Amateur Radio Service.

The situation is not all doom and gloom, however. Frequency allocations used
in amateur radio satellite communications did fare well at the World Radio

Conference held in Geneva, Switzerland late last year. WRC 97 delegates did agree to upgrade the Earth Exploration Satellite Service from secondary to primary at 1215 MHz to 1300 MHz, which should have only minimal impact on amateur use of 1240 MHz to 1300 MHz. The presence of these satellites reduces the possibility that other, less-compatible services might later be introduced into this band.

* WT0N SK *
==========
It is with great sadness that the passing of B.J. Arts, WT0N, is reported. BJ, who was 37 years old and had suffered for a number of years from acute diabetes, reportedly succumbed to flu soon after being taken to the hospital on the evening of 08-Feb-98.

BJ was very active on the satellites and VHF bands, and acted as editor of the AMSAT-NA's AMSAT News Service bulletins for the past several years. AMSAT News Service bulletins are available on amateur packet radio and via the Internet.

BJ sent a QSL card to SpaceNews on 17-Mar-91. On his card, BJ wrote:

John:
Just wanted to let you know I like SpaceNews. Great Info!

73 es God Bless
BJ

BJ was a very special person who gave of himself to help others, and will be sorely missed by all.

* OSCAR-11 NEWS *
=================
During the period 14-Jan-98 to 16-Feb-98, good signals have been received from UoSAT-OSCAR-11's 145.826 MHz VHF beacon. Three reports of the S-band beacon have been received. Masa, JA0BES, reports signals of one S-unit above the noise using a 34 element beam and Maki-Denk1 converter. Joe, KC6SZY, uses a 76-cm dish with 2.5 turn helical feed into an SSB Electronics converter. He reports S3 signals, compared to DOVE's S6. Joe has very kindly sent Clive Wallis an audio file of the signals which he has added to his OSCAR-11 Web site (details below). Ken, G8VR, also reports hearing OSCAR-11 and DOVE on S-Band.

UoSAT-OSCAR-11's telemetry has been nominal. After a slight fall, the internal temperatures have stabilized at around at 5.4C and 3.0C for battery and telemetry electronics respectively. The change in temperature is due to variations solar eclipse times. In recent years, the satellite has been subjected to long periods of continuous sunlight which has produced fairly high internal temperatures (eg. battery 22C, and beacons around 34C). Eclipses are expected throughout 1998 which should result in lower temperatures with fairly small variations.

A single WOD survey has been transmitted during the reporting period. Channels 10, 20, 30, 40 (+Y, -X, +X array currents, array voltage), dated

06-Jan-98. This shows the effect of solar eclipses on array currents and voltage.

OSCAR-11 users are welcome to visit Clive Wallis' OSCAR-11 Web site. Clive has recently added some audio files, including the Mode-S recording made by KC6SZY, which plays for 20 seconds. The other audio files are examples of each type of data transmitted by OSCAR-11, and each one plays for about ten seconds. All the audio files are compressed (ZIP), so that they can be played off-line. They should help listeners identify the various types of data transmitted by OSCAR-11, and give an indication of the signal quality required for successful decoding. The web site also contains some software for capturing data, and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis, which is continually being expanded as new data is captured. The URL is:

http://www.users.zetnet.co.uk/clivew/

UoSAT-OSCAR-11's operating schedule remains unchanged:

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

There are also additional status blocks after each bulletin is transmitted, and between ASCII TLM and WOD.

The Mode-S beacon is ON transmitting an unmodulated carrier, but telemetry indicates that it has partially failed and delivering half power. This beacon is a useful test source for those testing Mode-S converters, prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing. Any reports of reception of UO-11's 2401 MHz beacon would be most welcome, and should be directed to Clive Wallis at: g3cwv@amsat.org.

The 435.025 MHz beacon is normally OFF. However, it can sometimes be heard when the satellite is being commanded by ground control (ie. within range of Guildford, UK). When the 435 MHz beacon is transmitting, the 145 MHz beacon is normally OFF. The data transmitted is mainly binary.

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* VOYAGER 1 NEWS *
==================
PASADENA, Calif. (Feb. 17) - More than 6.5 billion miles from home, a U.S.
spacecraft carrying the sounds of a human kiss and the best wishes from a
former president has become the most distant man-made object in the universe.

Voyager 1 - so far away after more than 20 years hurtling through space
that its signals take more than 9 1/2 hours to reach Earth - surpassed the
distance of the older Pioneer 10 spacecraft by midday Tuesday, 17-Feb-98.

"Now the baton is being passed," Edward Stone, director of NASA's Jet
Propulsion Laboratory and Voyager project director, said in a statement.

Voyager 1 and the elderly Pioneer 10 are headed away from the sun in nearly
opposite directions. Both are powered by nuclear batteries that keep them
functioning in the freezing blackness of space.

On the edge of the solar system, Voyager 1 still returns data, although the
power of the signal reaching NASA antennas is 20 billion times weaker than
the power of a digital watch battery.

Voyager 1 was launched from Cape Canaveral, Florida, on 05-Sep-77, carrying
scientific instruments for planetary exploration and a message to the
universe.

The latter is a 12-inch gold-plated phonograph record containing a variety of
sounds, 115 analog images, spoken greetings in 55 languages, printed messages
from former President Jimmy Carter and then-U.N. Secretary General Kurt
Waldheim and a selection of music.

The sounds include wind, rain, surf, a chimpanzee, a Saturn 5 rocket,
footsteps, a heartbeat, laughter, a mother's kiss and a blacksmith, among
others.

The images range from the structure of DNA to a diagram of continental drift and a violin with sheet music.

The record was assembled by a committee that was headed by the late astronomer Carl Sagan.

Voyager 1 passed by Jupiter on 05-Mar-79 and Saturn on 12-Nov-80. Saturn's big moon, Titan, bent the trajectory northward out of the plane of the ecliptic, the plane in which all the planets except Pluto orbit the sun.

Pioneer 10 was launched on 02-Mar-72. Its mission officially ended on 31-Mar-97, but science data is occasionally sent to Earth in a training program for flight controllers.

Barring breakdowns, Voyager I is expected to have enough electricity and propellant to operate until about 2020. By then, the spacecraft will be almost 14 billion miles from Earth.

Try this little formula. It has worked for me with dishes from 1.2Ghz
to 10Ghz.

Focal Point = Diameter Squared
- - - - - - - - - - - - - - - -
Depth * 16

or a 30 inch dish with 3.75 inches depth works out like this :
(30 * 30) / (4 * 3.75) = (900) / (60) = 15.0 inches Focal
distance.

F/D Ratio = Focus / Diameter or

15 / 30 = .5

Hope this helps and is much simpler than finding software etc. hi hi

Are you sure about that? If I read the above correctly, you're drawing
the normals to the surface at various points, and seeing where they
intersect. Unfortunately, they don't intersect in a single point (or the
paraboloid would be a sphere) and all of them pass well outside the focus.

Even if it were a sphere, the focal length would be HALF the radius.

I greatly favour doing this sort of thing by trial and error. Even if
you do meticulous calculations, you have to finely adjust the thing by
T&E.

Scuse my split infinitive.

I have been trying to receive the noaa12 and 14 and met 3/5 wefax
pictures
with the wxsat program without much luck. even when I record the
sound file and then post process it, I still don't get a picture.
I built a 2m turnstile antenna, but my vertical give me a better signal.
:(I can't seem to recieve a signal until the sat is 25deg or so in the
sky with the turnstile.
Can I adjust the distance between the
reflector and the antenna to adjust my pattern? what is the rule of
thumb?
It also seems to have quite a bit of fading. I hear it for 10 sec. and
then the signal drops. Could it be that I have
the wrong handed polarization? which way should it be polarized?
I build a broadband preamp from a kit. It is susposed to have somewhere
around 20db, but high noise, (2.5db). I have mounted it at the
feedpoint and I notice a difference in signal strength, but it doesn't
seem to be enough for the computer to analyse the signal.
I have a SB 32 AWE soundcard and am using my DJ-560 HT for reception on
a K6-200.
I built the audio filter that was shown where I downloaded the program,
but it is hard to test it's effectiveness, and it didn't seem to do
much.
I always can hear the signal and the sync bars often show up on the
screen, but the rest of the picture is full of "noise", like a dead
TV channel with a sort of picture in the background if I use a little
imagination, if anything.
thanks,
KS4TY, Eddie

Point it at the sun (or other tabloid), then get a piece of paper and
move it around in front of the dish. When it goes on fire, mark the spot
and install the feed there......

Gary's right, with some caveats. If the reflecting surface is a
parabola with a high f/D or a spherical surface, you can move the
feed around in the focal plane (or more properly, the focal surface)
without unacceptable defocusing. These conditions are typically NOT
met for a RF dish; however, optical telescopes depend on this property.
And I have some personal experience with a 340' dish at 21 cm (f/D=1.5);
it does work at RF if you're thinking big.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial WWW:

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

I know that Inmarsat-C RX is 1.53 to 1.545 GHz, right hand circular
in 5 KHz steps. The Trimble xcvr uses a quadfilar helix. The modulation is
BPSK at 1200 symbols/sec with 1/2 rate convolutional encoding.

450. QST for Feb 98 / Drake Downconverters for Sale

Newsgroup: rec.radio.amateur.space

Good Day to You;

Yes !!! We do have the Drake 2880 Downconverters in stock.

We test them 100% before shipping.

Pricing is as follows:

$39 each or 3 for $100. Price includes Power Supply/Inserter
and shipping. Personal Checks are OK. COD is an additional $5 per order.
All Orders are shipped via Priority Mail (that way there is no long wait)

All orders are shipped the same day(unless there is an earthquake,
hamfair, Sunday or such that woukd keep us away from the Post Office).

E-Mail Orders are accepted. Sorry, no plastic (read: credit card).
P.O.Box Address is OK for "ship to".

I look forward to hearing from you;

73 de Bob WB5OHH

Hello all. There is a mistake with this message I sent a few days ago. I must rapidly correct this so I am forwarding this via the original channel used on the 21st of February. In the message that follows, placing the meter (yard) stick in the belly of the dish intersects the focus. IT DOES NOT! The yard stick intersects the line from the center of the dish at TWICE the focal length. Most sorry for the mistake. 73 Cliff K7RR

On Sat, 21 Feb 1998, Clifford Buttschardt wrote:

A correction is necessary to the "two sticks" application for finding the
focus of a dish. If two meter sticks are used, they will cross at TWICE
the focal distance rather than at the focus. Sorry Cliff K7RR

Rodger,
You will need a dish, preamp and antenna to have good reception.

Even that's only an approximation for a shallow dish or a spherical one.

It is quite easy to build a helical beam antenna for this frequency and service. The other commenter indicated a quadrafilar helix, but this is inappropriate since the satellite is geostationary and not LEO. You should be able to hear the Atlantic Ocean east and west satellites, and perhaps the Indian Ocean satellite. However, be advised that much of the traffic is no longer on the "A" service, which is analog FM. Much of it has moved over to the "M" digitized voice and the "B" high speed data / voice service, neither of which you will be able to decode with the AOR3000A.

Hi,
you might to try and download "WxSat" freeware. Can't remember where I
got it from but try "amsat.org", if they don't have it they will be
linked to it. I use WxSat on orbital sats. and its terrific. It can be
used on HF FAX too but haven't tried that yet. You might try JVFAX, but
again can't remember where I downloaded it from but its fairly well
known and easily available. The JVFAX software has a file with circuit
diagrams in it, but if I were you I would look for software that doesn't
need an interface, - it uses your sound card as an A to D convertor.
(you need a sound card of course).
Hope that helps,
Willy, GM3NUF.

Hi,
Re. your WxSat problems. The first thing is to get a good strong signal from the bird. From what you say I would suspect your antenna setup. A 2 metre antenna may be far enough out to be fairly inefficient on 137 Mhz and I would do a rebuild. You may have the wrong handed polarisation but to describe it here is awkward, it would be quicker for you to experiment.
After you've got a good audible signal if you still have problems post again, or email me.
I use a 137Mhz turnstile, on the house roof, and get fairly satisfactory results. I can access the bird when she's about 5 degrees high and typically get 10 to 13 minute passes. Not much to see in this awful weather we're having over northern europe.
Good luck,
Willy GM3NUF.

Eddie,

The other responder is definitely on track. I would rebuild a turnstile for 137Mhz. You can scale a 2M design or use the design from the "Weather Satellite Handbook". If you scale the 2M design I would increase the spacing between the upper and lower crossed dipoles to 3/8 wave vs. 1/4 wave of the usual designs. It gives you more gain at the horizon where your losses are higher and a smidge less at zenith where your losses are lower. Once you've got that done listen to the signal. If its full quieting and clean then you've got a good start.

What is the IF bandwidth of your handheld? You need at least 40-50Khz to get the full bandwidth and allow AFC to track for Dopler.

* SCHOOL CONTACTS WITH MIR *
============================
It has been nearly a year since the last SAREX school group talked to
an astronaut on Mir. Since that time, the amateur radio community has
witnessed (through the Mir ham radio link) the collision between the 12
year old Mir space station and the Progress resupply ship in June and
recovery operations by the various Mir crewmembers. Until recently, the
Mir crew's full attention has been focused on recovery from the collision
and restarting the scientific investigations that were abruptly stopped
after the accident.

Monday, 23-Feb-98 marked a new era for the Mir Space Station: The return
of SAREX school group contacts. On the morning of the 23rd at about
7:30 AM PST (15:30 UTC), six youngsters from the Shell Beach Elementary
School in Pismo Beach, CA, made a successful contact with Astronaut Andy
Thomas on the Mir space station. The students were in grades 1 through 6
and were able to ask Andy a total of 10 questions during the approximately
ten minute contact.

The Shell Beach School has been on the contact list for some time and they
were originally scheduled to talk to astronaut Jerry Linenger last April,
but due to technical difficulties on Mir, the contact was postponed until
now. The school had about a weeks notice of the impending contact. During
the week, the children scrambled and practiced several times, getting their
performance just right. After the session with Andy, the kids were very
excited and appreciative of all the effort that the SAREX Work Group, their
school and their teachers put forth to make the contact possible. A group
"Thank You" from the children echoed over the teleconference after contact
with astronaut Thomas was lost.

The contact was made using the Houston Telebridge station (W5RRR) with
Matt Bordelon, KC5BTL, at the controls.

About 150 people attended the SAREX contact including about 75 students. When the contact was over, one of the students commented, "This was really cool...a once in a lifetime experience".

The following day, a second SAREX school also completed a successful interview with astronaut Andy Thomas, KD5CHF. The Prairie Hills Elementary School in Colorado Springs, Colorado completed a successful direct contact with Andy on Tuesday 24-Feb-98.

After hearing that the second school group contact was successful, Frank Bauer, KA3HDO, AMSAT's Vice President for Manned Space Programs said, "It gives me great pleasure to know that the school group logjam is finally starting to clear. It was exciting to hear the student's reactions to the contacts and rewarding to know that we have provided an experience to the communities of Shell Beach and to Prairie Hills that they will never forget".

Rob Roller, N7LV, submitted the following comments following the Praire Hills Elementary SAREX school group contact with Andy Thomas on Mir:

"What a thrill! About 300-400 kids in the gym, all three networks with a video crew there, 10 excited kids waiting to ask their questions, and a great crew of radio operators and video camera operators. All of this came together at slightly after 9:07 this morning when we finally made the contact with Andy Thomas on Mir.

All the people in the gym watched closely as the overhead display showed Mir on its track to Colorado Springs while they listened to the static over the gym's PA speakers. When Andy Thomas' voice broke through, I'm sure I could hear plenty of suppressed "Yea!" expressions. Andy talked for several seconds, describing what he's doing on the Mir. Then the kids asked their questions and Andy answered all that he could hear. By the seventh question, Mir was dropping rapidly toward the horizon and we were losing the signal quickly. Unfortunately only six questions were answered by Andy, but the rest were answered by our two speakers.

Following the contact, two speakers answered yet more questions for about another half an hour from excited kids. Major Mike Caylor from the USAFA and Eric Joern, with about 10 years experience training the astronauts, answered many more questions for the next 30 or 40 minutes."

Rob extends his sincere thanks to all who helped make this contact a reality.

SAREX currently has a backlog of 60 to 80 schools that have been waiting patiently for a schedule to speak to an astronaut in space for the past several years. SAREX is not currently accepting any new applications for contacts. Further information on SAREX/MAREX school schedules can be found on the American Radio Relay League's Web Page at: http://www.arrl.org.

* HONOR FOR G3AAJ *
==========
Ron Broadbent, G3AAJ, was honored by the Radio Society of Great Britain

(RSGB) last Sunday, 22 February, when he was presented with their Louis Varney Cup; Louis' callsign, G5RV, may be familiar to some.

The cup is in the gift of the RSGB's VHF Committee; it is presented annually for "advances in space communication".

Ron's 20 years of service as Secretary of AMSAT-UK, before his retirement last December, make him well fitted for this honor. Many advances could not have happened without his tireless work for the good of amateur satellites and the amateur radio fraternity worldwide.

[Info via Richard W. L. Limebear, G3RWL, Communications Officer, AMSAT-UK]

Hi all!

I bought a Lafayette HA-50A FM Radio receiver (30MHZ to 50MHZ) recently in
a flea market.
Now I am starting to get more interested in this thing and would like to
buy a transmiter (or transceiver).
Do I need Liscence to use this band?
Wich transmiter or tranceiver would you recommend to use for this
frequency?
How far a trasnmitter in this band can go?
What type of antenna I need for this receiver?

As you probably noticed, I am new to this hobby ....

Cheers

Milton Martins

I am trying to get started in the field of working some of the amateur radio satellites that are currently in orbit. Right now, I only have a small 2 meter ht that I am using. Does anyone know of some good amateur satellites that I should be able to hear (and possibly work) from my home here in Kentucky? Also any info on the time of day or tracking when these satellites should be overhead would also be helpful. Thanks!

Hi Willy;
Are you able to transmit HF wefax? if so I would like a sched.

480. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1998-03-03 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <6dfovj$jn1$1@blackbird.afit.af.mil>
Source record: 16804

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from

archive.afit.af.mil (129.92.1.66)

in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-four character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01 Line Number of Element Data
03-07 Satellite Number
08 Classification (U=Unclassified)
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Day of the year and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
45-52 Second Time Derivative of Mean Motion (decimal point assumed)
54-61 BSTAR drag term (decimal point assumed)
63 Ephemeris type
65-68 Element number
69 Checksum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69 Checksum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 14
1 23455U 94089A 97320.90946019 .00000140 00000-0 10191-3 0 2621

484. Using a TV Tuner for NOAA satellites

Newsgroup: rec.radio.amateur.space
Date: 1998-03-03 00:00:00 UTC
From: grco@diogenes.hcuge.ch
Message-ID: <01bd46b0$f30632a0$4056c381@porl_yo34.hcuge.ch>
Source record: 16808

Does anyone have any experience in using a TV Tuner (audio output) set in the cable band or so called S channels to get a Wide-FM in the 137-139 MHz band ?

Is it possible to get signals from the NOAA satellites this way ?

Thanks in advance G.Cosendai HB9-VJT

Not at all. AMSAT are getting a very deep discount on the price
of the launch - in effect, we are hitching a ride into orbit,
and offering a small token payment toward fuel costs.

Do you know what the going commercial rate is to lob 400 kilos
into geosynchronous transfer orbit?

A successful launch (or any launch, for that matter) depends on
jumping through the right hoops. Or coughing up a *lot* more
money than AMSAT has kicking around.

488. DSS satellite dish and RF

Newsgroup: rec.radio.amateur.space
Date: 1998-03-03 00:00:00 UTC
From: David Guy <dguy@ma.ultranet.com>
Message-ID: <6di9l2och1@decius.ultra.net>
Source record: 16812

I know this post is not directly related, but I figure all you satellite gurus could help me. I want to put a dish 2 feet away from a 2 meter vertical antenna that puts out about 45 watts. Will I get interference? I'm afraid that the answer is, "of course!". The dish would also be about 50 feet from a 1500 watt HF RF source. Theoretically coax is well shielded, but I don't know how well shielded the electronics at the dish are.

Another question is how far away should the dish be from an RF source if 2 feet is bad?

Thanks and 73,
NY1L

TV audio usually works using the intercarrier principle. The vision
carrier is demodulated (AM) and from the result, a 5.5 MHz audio subcarrier
is filtered and FM-demodulated.
You cannot use this circuit to demod an FM carrier without the associated
vision carrier.

Of course an S-channel tuner covers the correct range and could be used
as a first stage in a homebuilt receiver (with different IF processing)
but I would not do that, the input filtering is too wide so you get all
kinds of other signals that can cause intermod.
It is better (and easier) to convert an old FM car radio.

There's no need to worry about interfering with the DSS dish from nearby high power levels of clean HF and VHF. My arrangement is similar (although not quite as close as 2 feet) and I've never experienced a problem. The only interference threat I've ever heard of at Ku- or Ka-band frequences is from terrestrial-based high-power point-to-point microwave, as used in telephone relay before fiber optics. The only real worries you have are 1) keeping HF and VHF out of the TV set, and 2) avoiding degradation of the performance of your 2-M vertical.

DSS signals are in the Ka band (12-13 GHz). At the dish, the block downconverter shifts the band down to 950-1450 MHz, which is carried by coax to your DSS receiver, which probably uses a 70 MHz IF. This arrangement makes everying up to your TV set nearly immune to RFI at HF and VHF.

You can hear D0-17 on 145.825 and work Mir and the shuttle as well. It can be done with an HT but it's not easy. You'll need a sat tracking program to keep tabs on where the sats are also. STSORBIT PLUS is one of the best. I have a link to it on my web site. Orbital data can be had from various web sites, my site has a direct link to Nasa's spacelink element page. Need more info? E-mail me!

The sound carrier is 4.5 MHz in NTSC sets. If you inject a 45.75 MHz
signal prior to the video detector, it will take the place of the visual carrier
and allow you to use the receiver for a sound only signal. If you make this
oscillator tunable, it will act as a RIT to the channel selector tuning. The
deviation of TV sound (NTSC) is 25 kHz, which is closer to what you want
for Wx satellites than the 75 kHz deviation of a FM broadcast signal. But it
is still too wide for best SNR. And the video IF of the TV is definitely not
optimal. You *can* repeak the IF transformers in the video IF to narrow
the passband. That'll help SNR, but of course will make the TV useless for
its normal purpose.

All in all, it is easier to change the filter in a scanner than it is to try to
use a TV or FM broadcast receiver for Wx sats.

No, surely they've got to be studying Tucana the toucan - surely swans
would be off topic :)

501. AO-27 and DO-17

Newsgroup: rec.radio.amateur.space
Date: 1998-03-05 00:00:00 UTC
From: Steven Jackson N3VZL <steve@gnosis.slac.com>

Source record: 16825

Sorry if this is a FAQ, but I just noticed that DO-17 and AO-27 are very close to each other lately. I also saw that their altitude varies by 8 km. Has anyone calculated the closest those two satellites will ever come?

I know AO-13's reentry date was calculated hours after launch, but I've never heard about a calculated collision date for these two.

In particular, the evening of March 12 looks pretty intense near the poles.

Just wondering! Thanks.

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...
Down load a demo or just view the software main screen at our web

* HAM RADIO AND AMSAT FEATURED IN NY TIMES *
==========
AMSAT-NA Executive Vice President Keith Baker, KB1SF, has reported that
AMSAT is included in a feature article about Amateur Radio and the Internet
in the Thursday, March 5th edition of the New York Times newspaper. The
article, written by John Verity, a New York Times feature writer, is
contained in a recently added section of the paper called "Circuits".
The story examines the links between the Amateur Radio hobby and the
Internet, and how Amateur Radio and AMSAT have both expanded and exploited
those links over the years. The AMSAT-NA Web Site http://www.amsat.org was
included along with others as a source of information on the amateur radio
satellites.

"Mr. Verity and I spent a few hours on the telephone talking about the
continuing magic of Amateur Radio and what AMSAT has done to spark new
ways of telecommunication over the years", said Keith. Keith is shown
operating on the satellites from his "shack" in one of the two photos
included with the story.

Keith reports that Mr. Verity was quite impressed with the ease with which
we regularly communicate through our fleet of AMSAT satellites. "He was
most impressed with the fact that we can, for example, communicate via
one of our MICROSATS using nothing more sophisticated than a low powered
hand-held radio and a flexible antenna," said Keith. "The carpenter's rule
antenna material we regularly use aboard our satellites also caught his
attention," he said.

Says Keith, "Needless to say, this story is great publicity for AMSAT and
for Amateur Radio as a whole. If it sparks enough interest in just one
youngster to become a Ham then it was well worth the effort!"

[Info via the AMSAT-NA News Service]

* MIR APRS EXPERIMENT *
==========
The MIREX (Mir International Amateur Radio Experiment) team would like to announce an Automatic Packet/Positioning Reporting System (APRS) test that is scheduled for 10-Mar-98 beginning at 1455 UTC and lasting through 1651 UTC. APRS stations will be allowed to use the Digital Repeater (R0MIR) on the Russian Mir Packet Station during the period of this experiment, which will cover approximately 99% of the USA on two orbits of Mir.

MIREX hopes that schools will be able to take part in the experiment by logging into one of the APRS Web sites (www.aprs.net) to track APRS beacons across the US. Hams are also encouraged to set up packet stations at schools to allow students and educators to witness the experiment first-hand.

The Mir PMS frequency is currently 145.985 FM simplex. The Mir Digital Repeater callsign is R0MIR. After 10-Mar-98 @ 1651 UTC, APRS should NOT be used via Mir.

A recent 2-line Keplerian data set for use in tracking Mir follows:

Mir
1 16609U 86017A 98063.08565753 .00008828 00000-0 10311-3 0 3011

[Info via Dr. Dave Larsen, N6CO]

* EVIDENCE OF ICE DISCOVERED ON MOON *
==========
There is a high probability that water ice exists at both the north and south poles of the Moon, according to initial scientific data returned by NASA's Lunar Prospector. Just two months after the launch of the cylindrical spacecraft, mission scientists have solid evidence of the existence of lunar water ice, including estimates of its volume, location and distribution. "We are elated at the performance of the spacecraft and its scientific payload, as well as the resulting quality and magnitude of information about the Moon that we already have been able to extract," said Dr. Alan Binder, Lunar Prospector Principal Investigator from the Lunar Research Institute, Gilroy, CA.

The presence of water ice at both lunar poles is strongly indicated by data from the spacecraft's neutron spectrometer instrument, according to mission scientists. Graphs of data ratios from the neutron spectrometer "reveal distinctive 3.4 percent and 2.2 percent dips in the relevant curves over the northern and southern polar regions, respectively," Binder said. This is the kind of data 'signature' one would expect to find if water ice is present."

However, the Moon's water ice is not concentrated in polar ice sheets, mission scientists cautioned. "While the evidence of water ice is quite strong, the water 'signal' itself is relatively weak," said Dr. William Feldman, co-investigator and spectrometer specialist at the Department of Energy's Los Alamos National Laboratory, NM. "Our data are consistent with the presence of water ice in very low concentrations across a significant number of craters." Using models based on other Lunar Prospector data,

Binder and Feldman predict that water ice is confined to the polar regions and exists at only a 0.3 percent to 1 percent mixing ratio in combination with the Moon's rocky soil, or regolith.

Assuming a water ice depth of about a foot and a half (0.5 meters), the depth to which the neutron spectrometer's signal can penetrate, Binder and Feldman estimate that the data are equivalent to an overall range of 11 million to 330 million tons (10-300 million metric tons) of lunar water ice, depending upon the assumptions of the model used. This quantity is dispersed over 3,600 to 18,000 square miles (10,000-50,000 square kilometers) of water ice-bearing deposits across the northern pole, and an additional 1,800 to 7,200 square miles (5,000-20,000 square kilometers) across the southern polar region. Furthermore, twice as much of the water ice mixture was detected by Lunar Prospector at the Moon's north pole as at the south.

"This finding by Lunar Prospector is primarily of scientific interest at this time, with implications for the rate and importance of cometary impacts in the history and evolution of the Solar System," said Dr. Wesley Huntress, NASA Associate Administrator for Space Science. "A cost-effective method to mine the water crystals from within this large volume of soil would have to be developed if it were to become a real resource for drinking water or as the basic components of rocket fuel to support any future human explorers."

Lunar Prospector is scheduled to continue its current primary data gathering mission at an altitude of 62 miles (100 kilometers) for a period of ten more months. At that time, the spacecraft will be put into an orbit as low as six miles (10 kilometers) so that its suite of science instruments can collect data at much finer resolution in support of more detailed scientific studies. In addition, surface composition and structure information developed from data returned by the spacecraft's Gamma Ray Spectrometer instrument will be a crucial aspect of additional analysis of the polar water ice finding over the coming months.

507. Re: Hearing satellites on my HT

Newsgroup: rec.radio.amateur.space
Date: 1998-03-06 00:00:00 UTC
From: Paul Lantz <plantz@onlink.net>
Message-ID: <6dqe3dbcu1@onlink3.onlink.net>
Source record: 16831

I didn't even think of trying to work satellites with an HT until I saw an article in Jan QST about working AO-27. I was a bit skeptical but ordered the suggested antenna (MFJ 1717 - 1/2 wave on 440 and 1/4 on 2 meters). I downloaded a couple of demo tracking programs and eventually bought Nova for Windows (www.nlsa.com). I set up the memories on the HT as suggested (5 pairs of frequencies, spaced to allow me to quickly handle the doppler effect as the satellite came closer and then moved away).
Well, it worked. It really amazed me to be able to make contacts with people more than a 1000 miles away with 5 watts from a hand held. I may get into satellite work more seriously some day but this was a cheap and fun way to get started. Only problem is that on weekends a lot of people are using the satellite. Oh yes and it can be cold standing outside and you do get wierd looks from people who watch you waving around antenna to maintain best signal.

Michael Brown wrote in message <6ddv5ddmm1@newsd-111.bryant.webtv.net>...
I am trying to get started in the field of working some of the amateur radio satellites that are currently in orbit. Right now, I only have a small 2 meter ht that I am using. Does anyone know of some good amateur satellites that I should be able to hear (and possibly work) from my home here in Kentucky? Also any info on the time of day or tracking when these satellites should be overhead would also be helpful. Thanks!

Radio Meteor Observation Bulletin No. 55 March 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Barcelona, Spain (01 59' E, 41 21' N)
Frequency: 48.250 MHz
Transmitter location: most likely Czech television C2 C. Budejovica,
100 kW, horizontal polarisation.
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (100 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT and
"Data Capture" software with 9 second/18 sampling interval to
store all the > 1.0 s signal increases.

Enric Fraile Algeciras

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
```

66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 deg (= E),
elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

February 1998

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

1998 | 21h 22 23 00 01 02 03 04 05 06 07
Feb | UT

Notes:
. ? probably affected by sporadic-E, direct reception.
. local time = UT + 1 hour.

Maurice De Meyere

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Notes:
. a quiet normal February month.
. local time = UT + 1 hour.

Pierre De Groote

Observer: Will Kelsey
Location: Santa Maria, CA, USA (120 26'9" W, 34 55'38" N)
Frequency: 107.9 MHz
Transmitter location: KXOA, Sacramento, CA, 50 kW FM, distance 362 km.
Antenna: Yagi FM 6 Element, heading North
Receiver: Sangean 803A

Observing Method: listening to audio (AGC disabled)

Underdense/Overdense Scale:
C-Dense: 0.5 Second or less
B-Dense: 0.5 to 3.0 seconds
X-Dense: 3.0 seconds or more

Estimated Signal Amplitude (ESA): 1 to 99 maximum
Interference (INT): Lo Med Hi

One hour observing period: 13h00-14h00 UT
(each observation hour is recorded in three 20 minute intervals)

Will Kelsey

Observer: Sadao Okamoto
Location: Damine Meteor Observatory, Japan (137.53 E, 35.07 N)

Transmitter: HAM beacon (JA9YDB) for RMO (50 W CW, 53.7500 MHz) by
JA9BOH Kimio Maegawa. No modulation except for identification.
Antenna: 2 element Cross Yagi 4 dBi aiming to Zenith. Omnidirectional
in azimuth and elevation above 15 deg elevation.
Location: Fukui-NCT at Sabae city (136.2 E, 35.9 N)
At present time about 10 observers are listing for
Kimio Maegawa's 53.75 MHz beacon.
Receiver: IC575 (-150 dBm) 500 Hz IF filter
Antenna: 2 element Yagi, pointed to the zenith
Observing method: FFTDSP software,automatic data saving and manual count.

Hourly echoes over 10 dB SNR

2. ANNOUNCEMENT

The cambridge-conference-list is a scholarly electronic network organised by Dr Benny J Peiser at Liverpool John Moores University, United Kingdom. For further information, please contact .

From: CAMBRIDGE-CONFERENCE DIGEST, 23 January 1998

BRITISH SCIENTISTS DEVELOP METEOR SCATTER PREDICTION MODEL

A. Akram & P. S. Cannon: A meteor scatter prediction model and its application to adaptive beam steering. RADIO SCIENCE, 1997, Vol.32, No.3, pp.1023-1035

A computer model to predict the underdense meteor arrival rate over a forward meteor scatter communications link is presented. The model incorporates important effects such as major shower streams, a nonuniform radiant distribution, and antenna polarization coupling.
...
A comparative study between monthly predictions and experimental data from a high-latitude link in Greenland over a year shows reasonable agreement but highlights the need for higher-resolution radiant data.

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.

Albert,

It seems that we shouldn't discuss this subject in a "public forum"
because it might interfere with ongoing negotiations between those
that "represent our interests" (AMSAT) and the space agency involved
(no agency named here because of sensitive feelings.)

There were some inflamatory comments posted to a bulletin board which
gave AMSAT an excuse to call negotiations and possible schedules a
"sensitive" matter (and discussion has been discouraged ever since.)

I am not near as disapointed with the failure to launch PH3D as I am
with AMSATs treatment of members.

You will probably get some replys giving you links to find the
latest news on the situation. (All of them are old or don't give any
new news.)

You may get some email from AMSAT officials
explaining why this should be kept out of a public forum.

Good Luck getting any real information.

Ken, K5MBV

Perhaps the lack of news is simply because there is no news?

I'm baffled at why people think there is some sort of conspiracy at work here - these things take time. Period. Even commercial launches (which we are not) take time. When our time comes, we will go. What more is there to say?

I sat in on part of the BoD meeting in Toronto last year (as documented in the current AMSAT Journal) and had some very frank discussions away from the meeting with several Board members. Is this the behaviour of an organisation that has things to hide?

Why the rush? Is your microwave system really ready to go? I could be on Phase 3D on 2.4 GHz more-or-less immediately. Could you?

I'm also well on track for 1268 MHz (easy, in both directions) and 10 GHz downlink capability (a little harder) by launch date - I could have it ready in a week or two, if I put my mind to it. How does this compare with your preparations?

...laura

520. 2 meter Sats. (HELP)

AO-27 can be heard on 436.800mHz and is the only FM satellite.
Remember that AO-27 only can be used during daylight. It should
make at least two passes per day within horizon of your QTH
during daylight hours. Uplink to AO-27 in on 2M @ 145.850mHz.

Mir can be heard on 70cm, but you must have very recent Keps to
track it.

See the Amsat homepage for more details on satellites at
http://www.amsat.org

522. Re: Rookie looking for info

Newsgroup: rec.radio.amateur.space
Date: 1998-03-09 00:00:00 UTC
From: fas@gate.net
Message-ID: <3503533b.28476339@news.gate.net>
Source record: 16747

Not easy to answer in a single message. You can work
AO-27 with a FM 2M/70cm rig and a couple of low gain yagis
or a high gain dual band vertical. Some have worked it from mobile.

To work the RS series you will need either two HF rigs for RS-12
or a HF rig and an all-mode 2M rig for either RS-12 or RS-15. These
two can be worked with eggbeaters on 2M and turnstiles on HF 10m/15m.

Mir can be worked with a 70cm FM rig.

Beyond these it can get complicated, so it is best to
refer to AMSAT homepage for more info. at http://www.amsat.org

This is already March. Almost looks like we won't get a launch this
year either (or at least before this year's Convention). Maybe 1999 ?

Why the RUSH? Are you kidding me? *Rush?* Get real.

We are very glad you did this and could do that etc., but
you aren't the subject of this thread. Congratulations on
your accomplishments anyway.

Try 145.985 simplex. This is the MIR frequency.

--

Bob Zimmerman - KC8CLB Diversity: The longer you verk here,
E-Mail: bobz@umich.edu deverse it gets.

Here in the U.S. the PMS HAS been online on 145.985. I've copied traffic
with no problem. Mir will be experimenting with APRS on the 10th by the way
from 1455 UTC to 1651 UTC. On the 145.985 U.S. frequency.

>I also intend to move up to UHF and want to know if there is some

Go to my web site (see sig) for Mir's 70cm freqs., I'm late for work!

73!
Tom

The point - which you obviously missed - is that my experience with AMSAT is completely inconsistent with a conspiracy or any sort of coverup.

Too bad basic reading comprehension isn't required for Internet access.

I'm receiving images from NOAA-12 and NOAA-14 with my scanner, but could you tell me which other satellites are active and receivable on a scanner.

I would also like to know which home made antenna is the best to receive those satellites, presently I use a groud plane antenna, but is there better?

Thanks

Over North America, Meteor 3-5 on 137.85 MHz. It only transmits
when it's in sunlight.

> I would also like to know which home made antenna is the best to

Some people use turnstile antennas. Others use quadrifilar
helices ("egg-beaters"). I use a dipole. They all work on
overhead passes, and they're all cheap.

536. NORAD Two-Line Orbital Element Sets (TLE157)

Newsgroup: rec.radio.amateur.space
Date: 1998-03-10 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <6e22j6$c66$1@blackbird.afit.af.mil>
Source record: 16761

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* CelesTrak WWW:

http://celestrak.com

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space. This site, however, will no longer be available after 1998 March 31.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

****

At last we can agree on something. (The ability to write without using the first person singular in nearly every sentence would be an improvement too.)

Your sarcastic ability is up there with the best flamers of AOL, but it doesn't contribute much information about PH3D.

I'm looking for a small dish for the upcoming phase 3D 2.4GHz modes. I would be REAL interested in finding information on how to determine the proper dish size and f/D for different uses. For example, I have a 10 foot TVRO dish that has a f/D of 0.40. Can this dish be used for the amateur frequencies with any success, if not, why not?

Thanks for any information!
73,
Tim K3TZ

You can use any commercial dish for this frequency. But you will have to put
the proper feedhorn (coffee can or dipole) for this frequency in the focal
point.
But remember, the bigger the dish, the narrower the openings angle is.
This 10 foot dish has an openings angle of about 2 degrees on 3.8 GHz.
Also, you may have to control azimuth AND elevation on this dish in order to
track the satellite. The bigger the dish, the bigger the motor has to be.
All you probabaly would need is a 4 foot or 6 foot dish.

546. Re: Hearing satellites on my HT

Newsgroup: rec.radio.amateur.space
Date: 1998-03-11 00:00:00 UTC
From: Tovar <tvr@nospam.mocha.ecofe.com>
Message-ID: <4mbtvd6p7e.fsf@spinner.ecofe.com>
Source record: 16771

AO-27 can be heard on 436.800mHz and is the only FM satellite.
Remember that AO-27 only can be used during daylight. It should
make at least two passes per day within horizon of your QTH
during daylight hours. Uplink to AO-27 in on 2M @ 145.850mHz.

Indeed, but don't necessarily expect to hear AO-27 on an HT without
either a pre-amp or a gain antenna, especially in urbanized areas.
Arrow makes an excellent handheld dual-band yagi specifically for
this purpose. You can order it direct from Arrow, or through AES
if you need to use 'plastic'. You will need a duplexer or separate
radios with that antenna; Arrow will install a 10W duplex in the
handle of your Arrow antenna if ordered at the same time. [I have
no connection with either organization, i've just heard a number of
experienced satellite operators use it with HTs on AO-27.]

IMPORTANT: AO-27 has a very sensitive receiver, so PLEASE do not
transmit until you can at least copy partial callsigns. Otherwise,
you'll just create QRM. With AO-27, if you can hear it, you can
probably work it (at least, on weekdays).

Contrary to a recent QST article, do NOT try to compensate for doppler
on the uplink on AO-27. It is unecessary, and under certain circum-
stances, it could adversely affect other satellite users.

Other FM satellites include the DOVE at 145.825 (beacon only) and MIR
at 145.895 (voice and packet, check which is on before transmitting).
Both you should be able to hear on good passes with an HT, but lots of
people try to work MIR, so it's not always easy to get into it. The
MIR/SAFEX repeater is also FM, but hasn't been available much recently
and is not easy to work.

It seems that we shouldn't discuss this subject in a "public forum"
because it might interfere with ongoing negotiations between those
that "represent our interests" (AMSAT) and the space agency involved
(no agency named here because of sensitive feelings.)

There were some inflamatory comments posted to a bulletin board which
gave AMSAT an excuse to call negotiations and possible schedules a
"sensitive" matter (and discussion has been discouraged ever since.)

I don't see a problem discussing P3D in this forum. There was a problem
with that in an AMSAT mailing list, as outsiders, who are subscribed,
were having difficulty telling what comments were official, which were
AMSAT members, and which were outsides. Nor did they necessarily have
experience with how folks in the 'States discuss politics.

The impression that i get, mostly from reading the writing on the wall
[which i've had some experience doing as a concerned citizen in city
government] is that it may be possible for P3D to fly on the next test
flight Arienne 5, but it is not likely to be announced until the last
minute. Preparations in Florida AMSAT facility appear to be progressing
at a rate which is reasonably consistent with that supposition.

Two other projects appear to have similar status, a new Phase A bird and
another satellite similar to AO-27. I don't think either are likely to
fly very soon, but i woundn't be surprised if all three are up within a
year or so.

This is a good time to work on your satellite station, and there are
satellites up right now with which you do at least limited tests, no
matter which of the three you're excited about.

Speculatively speaking,

-- KD6PAG

> or a high gain dual band vertical. Some have worked it from mobile.

Actually, a dual band vertical intended for terrestrial use is not what you want to get started. It's "pancake" pattern is great for repeaters and simplex work, but, by design, doesn't receive well skywards. The best antenna for AO-27 is made by Arrow (see my recent posting on same topic). If you have a pre-amp or a sensitive receiver (such as a good mobile rig), a simple 2 meter quarterwave may work for AO-27 (especially outside of urbanized areas) and will work much better than a gain antenna intended for terrestrial use. And with a dual-band rig, you won't even need a duplexer. Just don't get discouraged if you have trouble working AO-27 on weekends; it's often very busy, especially during transcontinental passes.

The only time i've found a high gain dual-band vertical to be of much use is on low elevation passes (in my case, max. elevation of less than about 15 degrees).

I assume that P3d going up on the next Ariane would only happen if
someone else didn't finish their satellite in time -- right? (Which
maybe isn't that uncommon -- it seems.) So, my
guess is that being overly confident about going up soon would really
piss off whoever is the other group trying to get theirs ready.

What kind of antenna setup would you use for P3d? Is the thinking that
the best setup would be 2m/440/L/S all on one big elevation rotor? Or
does it make sense to snatch up a used 2m/440 circular antenna set
now and then put up a completely seperate roof tower for L/S? Or would
this mean aiming two sets of rotors, and would that be just be
insanely difficult.

555. Looking for an DSP-2232

I know that some of the HP palm PDAs can run DOS and can therefore run any one of the several DOS based tracking programs. Is anyone aware of a tracking program that will run on the PalmPilot or PalmPilot Pro by 3Com/US Robotics? If not, know anyone that is planning on developing one?

Cross-posted to: rec.radio.amateur.space,rec.radio.scanner

Hello,

I am using a scanner and my soundcard to decode pictures from the NOAA polar orbiters and in the tradition of my hopelessly poor methods I would like to try to build a turnstyle antenna, or maybe even a quadrifilar... but I think I wanna go with a turnstyle first until I have better materials. Anyone have sufficient data for radial lengths and separation distances, loading (if any), wiring, etc. for a simple 137 MHZ turnstyle? I built a simple twisted loop antenna and it seems to work -ok- but for my current residence I need better gain and I like the turnstyle idea the best.

Thanks in advance for any help you guys can offer!

, Rick

Tim, you might also consider a yagi at this
frequency. It should be lighter with less
wind load and easier to build for the same
gain than a small dish.

You are right about working on the satellite station if the interest is in LEOs, but if not it may be early for spending a lot of money on PH3D Mode S and and other equipment. It should be easy to get ready if we had a realistic schedule from AMSAT. Those of us who build most of our own equipment would like to have real signals from the satellite for checking it out.

2m/440 will probably NOT be the bands to aim for. The bird is made to explore the microwave bands, not the VHF/UHF bands (although there will be some time on those bands, until more hams get microwave equip).

I am aiming for a 1.2g uplink and 2.4g downlink as the primary mode. And also 440 (70cm) uplink with a 2.4g downlink. I believe these will prove to be the links that are allocated the most time (eventually).

DX-World-Guide 1998 by DJ9ZB

Now available!

10 Years after the first edition we proudly present
```

now the completly new edition of Franz Langner&#65533;s, DJ9ZB,

DX-World-Guide. (English language!)

This A-4 sized book is a must for DXers, SWLs, expeditoners etc.

354 pages full of information with maps, QSLs, QSL-bureaus,

Information about IOTA-Nrs, WAZ, ITU-Zones, Grid-Squares,

UTC, Prefixes, ex-Prefixes, Radioclubs for each DXCC-country!

Also many information (Address, Tel., Fax) about licensing authorities.

Each DXCC Country is presented on one page.

Price: DM 30,- incl. p&p within Europe. (Euroceque or cash)

DM 40,- or USD 25,- incl. airmail Postage worldwide (cash only)

The book is available ONLY from the publisher:

DL8HCZ, Joe Kraft, Gruetzmuehlenweg 23, D-22339 Hamburg, Germany

For any further questions: FUNK-TELEGRAMM@t-online.de

Many greetings from Hamburg de Joe, DL8HCZ

571. Where to mount a feed in a dish ? (focal point?)

Hello,

Can someone tell me where to put a feed in a dish ?

The dish diameter is 90cm or radius is 45cm.
The depht of the dish is 13.5cm.
The dish is used at 1700MHz.

Who can help me working out these problem ?

!!!! ALL INFORMATION IS WELCOME !!!!

Thanks to all the peopele who write me!!

Point the dish at the sun in a cloudless sky.

Attach a small piece of thin card to a length of stiff wire.

And wiggle about for maximum smoke.

Does not work for a mesh dish.

Dear JM,

Like most people, I don't read the entire contents of newsgroups.

Very recently, because my screen was becoming extremely cluttered
up, I did some spring-cleaning and dumped everything into the
waste bin.

After a nice clean start almost the first subject to appear on
the screen was this one about focal points of dishes. The
original query was not displayed. There was a copy of the
original query in someone else's reply. So, as I had a little
time on my hands, I answered it in an entirely different manner.

Quite a coincidence. What did _you_ say? Are you an amateur
Newtonian Mirror telescope maker too ? In the USA they are known
as TN's (Telescope Nuts).

Yours, Reg.

MONDAY MARCH 16, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* COLLINS NAMED FIRST FEMALE SHUTTLE COMMANDER *
==
Astronaut Eileen Collins (Lt. Col., USAF) will become the first woman to
command a Space Shuttle when Columbia launches on the STS-93 mission in
December 1998. Collins will be joined on the flight deck by Pilot Jeffrey S.
Ashby (Cmdr., USN) and Mission Specialists Steven A. Hawley, Ph.D., and
Catherine G. "Cady" Coleman, Ph.D (Major, USAF). CNES Astronaut Michel
Tognini (Col., French Air Force) was named to the crew on November 12.

Selected as an astronaut in 1990, Collins has served as a pilot on her
two previous space flights. Her first space flight was STS-63 in February
1995 as Discovery approached to within 30 feet of Mir, in a dress rehearsal
for the first Shuttle/Mir docking. In May 1997, she visited the Mir space
station as pilot on board Atlantis for the sixth Shuttle/Mir docking mission,
delivering Astronaut Mike Foale and returning Jerry Linenger to Earth.

STS-93 will be the first flight for Ashby. Hawley will be making his fifth
space flight during STS-93, having flown previously on STS-41D in 1984,
STS-61C in 1986, STS-31 in 1990 and STS-82 in 1997. Coleman has one
previous space flight to her credit, having flown on STS-73, the second
United States Microgravity Laboratory mission in October/November 1995.
Tognini, who spent 14 days on the Mir space station in 1992, will be making
his first Shuttle flight on STS-93.

During the five-day mission, the crew will deploy the Advanced X-ray
Astrophysics Facility Imaging System (AXAF), which will conduct comprehensive
studies of the universe. AXAF will be the most advanced X-ray telescope ever
flown. When scientists begin using AXAF next year, they will finally be able
to unlock the secrets of some of the most distant, powerful and violent
objects known to exist in the universe. They will study such exotic phenomena
as exploding stars called supernovae, strange powerful objects called quasars,
and mysterious black holes which are so massive that everything near them is

pulled inside causing an explosion of X-rays that AXAF can study.

* KC5HBR RETIRES FROM ASTRONAUT CORPS *
=======================================
US astronaut Jerry Linenger, KC5HBR, who was aboard the MIR space station for 122 days last year, has retired from the astronaut corps, according to NASA sources. Linenger will pursue private interests.

KC5HBR was aboard the space station when a fire broke out just over one year ago, ignited by oxygen-generating 'candles' used on the spacecraft. The fire, a collision with a Progress supply rocket last summer, several computer failures, and other problems made international news and led some officials to question sending additional US astronauts to train aboard MIR.

Linenger, a physician and a captain in the US Navy, was aboard the Russian space station from January to May 1997.

[Info via the AMSAT News Service]

* DOVE-OSCAR-17 CRASH *
========================
DOVE-OSCAR-17 appears to have experienced a problem recently. It is currently off the air on 2-meters and as of last Thrusday, control station Jim White, WD0E, hash not been able to get it to reset properly. Jim reports that he will be working on the satellite, and expects the S-band transmitter's operation to be intermittent as he works with the ROM software and loader.

[Info via Jim White, WD0E]

* AMSAT ANNUAL MEETING CALL FOR PAPERS *
==
The 16th Annual AMSAT Meeting and Space Symposium will be held October 16 to 18th at the Park Inn International Hotel in Vicksburg, Mississippi. This is the first call to authors who wish to present papers at the Symposium and be printed in the official Proceedings document. The subject matter should be topics of interest to the amateur radio satellite community.

One page abstracts are due no later than June 1, 1998, and authors will be advised by June 15th regarding whether their paper has been accepted. Camera ready copies of the accepted papers are due no later than August 15, 1998.

Papers will only be superficially edited and will generally be printed as submitted. Authors are requested to provide an electronic file, preferably in any version of Word or WordPerfect.

Abstracts can be sent to:

Malcolm Keown, W5XX,
14 Lake Circle Drive
Vicksburg, Mississippi 39180.

Malcolm is also available via e-mail at: w5xx@magnolia.net

Proceedings of the Symposium will be printed by the ARRL and made available at, and after, the event.

Information regarding Vicksburg area attractions and details on arrangements for the 16th Space Symposium and AMSAT Annual Meeting can be found at:

http://pages.pordigy.com/DXHF93A

For additional information please contact:

Eddie Pettis, N5JGK
114 Terrace St.
Vicksburg, Mississippi 39180

Eddie is also available via e-mail at: n5jgk@amsat.org

[Info via the AMSAT News Service]

* JOHN GLENN TAKES HAM CLASS *
==============================
An unconfirmed report claims that US Senator and NASA astronaut John Glenn took Gordon West's ham class at Fry's Electronics in Southern California last weekend. John Glenn is preparing to fly on the STS-95 US Space Shuttle mission in October. A SAREX package is expected to be carried on STS-95. In addition to John Glenn, US astronaut Scott Parazynski, KC5RSY, and European Space Agency astronaut Pedro Duque, KC5RGG, of Spain, will be among the international crew aboard the STS-95 shuttle flight.

> payload.

The relevant information is on the web (http://www.orbital.com).

The short answer is no. Phase 3D will not fit inside the
Pegasus 3rd stage fairing. Even if it *did* fit, Phase 3D
is far too massive - Pegasus can only lob about 200 kilos into
geosynchronous transfer orbit, the starting point for P3D's
planned mission.

No, I'm not a Pegasus expert - I just read the numbers off
Orbital's web page, and compared them with published information
about Phase 3D.

This also excludes any discussion of integrating P3D with
Pegasus, any reengineering for Pegasus launch requirements,
(both physically impossible non-starters anyway) obtaining
a launch opportunity in the first place, paying for it in
the zeroth place, etc. etc. etc.

Assuming the dish is center fed, the dish surface can be described as a prabola.

Y^2 = 4 FX
Let Y = the radius
X = the depth
F = focal distance from the center of the dish to the phase center of the feed.

F = (Y^2)/(4X) = (45 x 45)/(4 x 13.5) = 37.5cm

Focal ratio (needed to design optimum feed) = F/2Y = 37.5/(2 x 45) = 0.42

Hope this helps you

John

By 'next year' do you mean 1999 ???
It is already the middle of March. Does not look to me like we will
get P3D on an ESA launch this year. Afterall we (AMSAT) being a
volunteer organization will need several months leadtime after any
announcement of a launch date before we could get the satellite to the
launch site and ready to go. So if they told us today, we could
probably not be able to go before summer. Slip the announcement a
couple more months and any launch would be after this years
convention/meeting in Mississippi.

I am looking for circular polarized antennas for 2m and 70cm with boom lengths of no more than 7.5 feet with center mounting.

They are for a special roof mounting on a mobile trailer. The crossboom thru the rotor is 10 feet so the antenna booms can be no wider than the top of the trailer (which will probably be 8 feet wide).

Hi
but I have some connection to a former radiotelescope, the site has been
taken over by some local German microwave amateurs like DK2UO, DG1KBF
and many more. Any radio amateur are invited to be a supporting member
of this microwave society, but I do not have the address available now
(sri) I believe the fee is only 20.-

They need all the support they can achieve because some strong interests
want the field to be taken over for a nearby golf course. So if you
choose microwave for golf it would be a good idea to support this, and
the worst side is that they pour out some poison on the ground to avoid
grass growing too fast, this spreads into the ground water.
It is one 10m dish mounted on a high tower and a smaller 5m diameter
dish on the site. And the place is on one of the tallest points between
K In and Weinheim.
I went there with DK2UO, Hei-Jo last time I was at the Weinheim VHF
meeting.

Re>Does not work for a mesh dish.....

Have you actually TRIED with a mesh dish? It works quite well sometimes.
Presumably the gain of a given mesh dish, at visible frequencies and
infra-red, is around half what it is for 10 GHz.

If you find it difficult to find the focal point with string, either see
alt.fan.goons (obsessed with string they are) or simply use a whitish
postcard.

Me, I'm keeping an eye the prices of used FT736's and TS790's
as people dump 'em for the FT847 or buy into the ham
radio malaise. I guess the ARRL VHF contest season is coming
up here. From the web page they have
it looks like there's a pretty active VHF/UHF club in the SF
Bay area. Though I assume I need either a pretty good tower
or camp out on a hilltop during the contest to really do the
terrestrial microwave thing proper. I might, at least,
hunt down a way to get on 2M ssb cheap and stick up a 5el
2m beam on my radio shack TV rotor -- then work some stations
during the VHF contest and try RS-12.

The deal, for me, is really I have a pretty strong desire to
put up an HF beam, For at least once in my life I want
to have a decent setup when the sunspots come up. I think
I'm going to do like an A3s or th3jr or something. That project
is going to keep me distracted for awhile. Still, I did call
up the 'employee' at Amsat and joined -- figuring maybe
that would do some good.

Hello

I have never used a quad on satellite before, but there was an
article in QST (I think) 7 or 8 years ago about quads with switching
for RHCP/LHCP. The article described both 2M and 70CM versions.
Wish I could remember more details, but...

That doesn't make any sense. why should i not compensate for doppler on the uplink?

Because AO-27 has a wideband receiver, so, in effect, it's compensating for doppler for you. I've forgotten the exact design of the spacecraft, but they may be using a DSP to receive FM, such as is done with RUDAK. If P3D were to receiver FM and retransmit SSB (as i've suggested), that is how it would be done there, as well.

Suppose for sake of discussion, that your transceiver has its deviation set +/- 5 KHz. That means that in the satellite sub-band, which you are sharing with SSB/CW transponders and other uses, your transmission will occupy from 145.845 to 145.855 MHz. If you have a step-size of 5 KHz (typical for most HTs and mobile rigs) and you attempt to compensate for doppler, during a given pass, your transmissions will occupy from 145.840 to 145.860 MHz, or about twice as much bandwidth. That corresponds to quite a few SSB channels and a very large number of CW signals. If linear transponder satellites is in the same part of the sky (or you're using an omni antenna with a lot of power), then you could be causing QRM to twice as many station. Hence, if an FM satellite does not need doppler compensation on the uplink, it's best if you don't supply it. (That is also one reason we don't want alot of mode J-FM satellites in operation, unless they all use the same uplink; it takes a lot of bandwidth compared to other modes.)

How in the world do you make a circular polarized quad? The driven element is inherently linearly polarized, and you can't stick two of them at 90-degrees like you can with a yagi. I suppose you could build two complete quads and mount them side-by-side on a boom, with one rotated
by 90-degrees, but putting a pair of 2m's and a pair of 70cm's up would be quite a load.

Now, if the original question was whether you can use quads to work satellites, the answer is yes. I used a homebrew quagi for a while, and in general have worked satellites for several years, *never* with a circularly polarized antenna. Yes, there are fades to deal with, but it's not that big of a deal.

Greg.

594. Guide to the rec.radio newsgroups

```
Archive-name: radio/personal-intro
Revision: 2.2 98/14/05 03:50:23
Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul
Schleck, K3FU, pschlect@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
newsgroups is so that folks who aren't interested in, say, homebrewing,
don't have to wade through messages about homebrewing on the way to read
about Field Day. Posting appropriately is just good etiquette.
```

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserve.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Heyyyyy....

Did you check out Taurus? It looks like a absolute winner!

And with as little as an 8 day turn around (Of course the mission requires
a bit more...but still..)

Have they been allowed to bid on this?

In the article, he put 2 quads on the same boom with one 1/4
wavelength ahead of the other. You can make a quad with either
horizontally or vertically polarized by by feeding either the vertical
or horizontal leg of the driven element. The polarazation switching
looked like a nightmare, but at least in theory, it should have
worked..

I think you are right, greg. If you want a linear polarized antenna,
a quad should work as well as a yagi.

You feed the quad at two points via a bead balun, I think you know the phasing harness part. This was brought up in 73's Amatuer Radio Today Feb 97 issue.

598. MIR APRS passes

Newsgroup: rec.radio.amateur.space
Date: 1998-03-16 00:00:00 UTC
From: bryan_weaver@harlequin.ca
Message-ID: <6ejr72ffn1@demon.uunet.ca>
Source record: 16724

Hi all. I wonder if anyone has an aprs hst file for the MIR APRS passes last Monday. I found out about it after the fact, so missed recording my own. If you do, either email to me, or post them to the newsgroup. I'm sure others would be interested too. (I presume the APRS passes actually happened!)

Thanks & 73 de Bryan, ve3trj

599. Modify Yagi Antenna ?

Newsgroup: rec.radio.amateur.space
Date: 1998-03-16 00:00:00 UTC
From: sco@sco-inc.com
Message-ID: <350d7451.826061@news.mindspring.com>
Source record: 16725
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.space

Can I cut the last end elements (vertical and horizontal) off of a
circular polarized yagi antenna and still have it work?

I need a shorter boom length than is available on the market.

I have the M2 2m and 70cm circular polarized satellite antennas.
Their boom length is about 10 ft. I need a boom length no more than
about 8 ft.

If I cut off about 2 feet on the end away from the driven elements,
how would that affect the antennas? Ruin them??? Wider angle?
I know they would have less gain (but I can live with that on P3D).

For TX I can increase my power easier than have a boom length that I
can not use (on the mobile shack I am designing).

Which Okean satellites are presently active, and what are their
frequencies please?

601. NORAD Two-Line Orbital Element Sets (TLE162)

Newsgroup: rec.radio.amateur.space
Date: 1998-03-16 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <6ekafh$2al$1@blackbird.afit.af.mil>
Source record: 16727

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* CelesTrak WWW:

http://celestrak.com

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space. This site, however, will no longer be available after 1998 March 31.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Will the element sets then be available via ftp from another
server (perhaps from one at the celestrak.com site)? It seems
to me to be still the easiest way to obtain them.

Well Im interested. I'm just about to errect a 4m mesh dish which is
presently shiny. As I live on the coast, (corrosion) and hope to
camoflage it from the neighbors somewhat, I was considering having it
painted with epoxy green paint in a local paint shop.

Has anyone numbers on loss of efficiency - as its a C Band antenna
and Im wanting to use it on Kband - I guess Im down to 35% efficent
without the paint -

Hi,

I have been using a pair of circularly polarized 8 element quagis on five foot pvc booms for 435 on fo-20, fo-29 and ao10 for about two years now. Gain is not great for ao-10 since I run low power on 435 but they work fine for receiving fo-20 and fo-29. They ar mounted on above the other (about five feet seperation) and phased so I can switch from RHCP to LHCP. According to what I read there isn't much difference in performance between quagis and quads. The quagi is simpler to build except that I find the quagi (or quad) driven element easier. Before I got an elevation rotator I used a short (five foot) quad on 2m at an elevation of 45 degrees. It also worked fine except for polarization shifts on fo-20.

On the question of cutting off the end of the M2 antenna; The manufacturer would probably cringe a bit but I doubt if you would notice much difference in actual use.

Hi all,

I will be going on a trip this Thursday and Friday. I plan on working
the following satellites from the following states and grid squares.

Road/weather/sleep conditions may change the schedule.

Look for N7SFI at 435.850 on FO-20 and FO-29
29.430 on RS-12

UTC DATE/TIME SATELLITE STATE GRID SQUARES

MAR 20, 1998 0256-0314 FO-29 ID DO32
MAR 20, 1998 1026-1038 RS-12 ID DN22/DN23
MAR 20, 1998 1210-1222 RS-12 OR DN12
MAR 20, 1998 1405-1410 FO-29 OR DN03/DN02
MAR 20, 1998 1552-1604 FO-29 OR/NV DN12/DN11
MAR 20, 1998 1642-1651 AO-27 OR/NV DN12/DN11
MAR 20, 1998 1821-1835 AO-27 NV DN01/DN11
MAR 20, 1998 2001-2012 AO-27 NV DN00/DN10
MAR 21, 1998 0014-0033 FO-29 NV DN20/DN21

If 10 meters is open I will be on 28.430.

73, Randy N7SFI

610. Join a Live Webcast: From Mir to Mars

Newsgroup: rec.radio.amateur.space
Date: 1998-03-18 00:00:00 UTC

>>>>>>>>>>>>>>>www.pbs.org/saf/mirtomars/<<<<<<<<<<<<<<<

Scientific American Frontiers presents...

FROM MIR TO MARS:

www.pbs.org/saf/mirtomars/

A live Webcast with Frontiers host Alan Alda (on Earth) and NASA astronaut Andy Thomas (on Mir).

MARCH 23 -- Time to be Announced

>>>>>>>>>>>>>>>www.pbs.org/saf/mirtomars/<<<<<<<<<<<<<<<

Web surfers and space buffs alike should circle Monday, March 23, on their calendars! "FROM MIR TO MARS," a live Webcast from the Russian Space Station Mir, will take place in the late morning (exact time to be announced). Alan Alda, host of the PBS series SCIENTIFIC AMERICAN FRONTIERS, will conduct a live interview with NASA astronaut Andrew Thomas, who is currently about halfway through his stay on Mir.

The Webcast will take place on PBS Online at http://www.pbs.org/saf/mirtomars/. Web users can watch and listen to this groundbreaking event using RealPlayer 5.0 video and audio streaming technology provided by RealNetworks. Web users may sign up now to receive an e-mail reminder shortly before the Webcast.

The Webcast will feature a 15-minute interview preceeded by a the 15-minute behind-the-scenes set-up period featuring Alan Alda and the producers. Footage from the interview will be used in a SCIENTIFIC AMERICAN FRONTIERS episode planned for the 1998-99 season that will examine the logistics of a potential human mission to Mars and the preparations that are underway. The U.S.'s presence on Mir has yielded vital information about how humans can survive and thrive in space for long durations, which is essential if the Mars mission is ever to become a reality.

The live interview will give viewers an opportunity to hear Thomas's thoughts on such a mission. He will comment on his experiences aboard Mir and what it's like to be so far from home. Thomas will describe the physical and psychological effects of living in space and the methods used for counteracting those effects. Thomas will also discuss how he believes astronauts on a mission to Mars might be affected by being too far away to look back and see Earth -- a situation not faced by occupants of Mir.

The "FROM MIR TO MARS" Web site (www.pbs.org/saf/mirtomars/) includes further information on the interview, Space Station Mir, NASA missions, Mars, and other related facts, resources, and classroom activities. After the Webcast, an archived version of the event will be available for future visitors to the FRONTIERS Web site to experience.

Scientific American Frontiers airs on PBS with five new programs each season. The next one-hour special is "The New Zoos," airing on most PBS stations April 15 at 8 p.m. (check local listings to confirm time and date)

SCIENTIFIC AMERICAN FRONTIERS is wholly underwritten by GTE Corporation, and is presented to PBS by Connecticut Public Television. FRONTIERS is a production of The Chedd-Angier Production Company in association with Scientific American magazine. Andrew Liebman (Chedd-Angier) is producing the "FROM MIR TO MARS" interview. A coordinated school outreach program and website (www.pbs.org/saf) is developed by Media Management Services. For more information on the FRONTIERS School Program or the website, call 800-523-5948 or e-mail saf@pbs.org.

Hey Cliff,

Did you use a Quad within a Quad design for a combination 440 and 2 meter or separate Quads? How many beads did you use for the 440 Quad if you are using a 440 Quad?

And tuning...do you have some slide mechanism to tune with?

Just about have mine done!

Christopher Cox

Heard the 29MHz beacon just a couple of days ago here in the UK.
2m is now for uplink. I put out a couple of calls and the 10m downlink
was reasonable - no replies this time, unfortunately :<

Have you looked at the M2 Eggbeater? They have a website (don't know
the URL).
Also, look at the antenna chapter of the new Satellite Handbook. It
talks about the Eggbeater as well as the Lindenblad and Turnstile
antennas. All circularly polarized.

Good Luck,
John, KB2YJH

> will be graefully appreciated. Thanks. Jag N2EP

As far as I know, the 2m beacon is off. Try listening to 29408Khz
during the pass. You should hear the CW beacon. If you hear the
beacon, then switch frequency to the passband (29410-29450Khz) and
listen for activity.

What kind of receiver and antenna are you using and how are you tracking
the bird to know when it's overhead?

Good luck,
John, KB2YJH

MONDAY MARCH 23, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* UoSAT-OSCAR-11 NEWS *
======================
OSCAR-11 celebrated its 14th birthday on 01-Mar-98. It is a wonderful
achievement by the UoSAT team who designed, built, and launched the satellite
in a period of only six months. Although there have been various component
failures during its long time in orbit, OSCAR-11 does have the habit of
bouncing back! Great credit to its design philosophy.

During the last week there have been some problems with OSCAR-11 and the
145 MHz beacon has been OFF. The beacon was heard on Monday 09-Mar-98 at
which time its telemetry was nominal. Nothing was heard on Saturday and
Sunday 14/15 March on 145 or 435 MHz. On Tuesday 17Mar-98 it was heard
on the 14:44 and 16:22 passes. On both passes, the 435 MHz beacon was
switched on after AOS. During the early part of the pass, binary data was
transmitted and then switched over to the 145 MHz beacon, indicating ground
control activities. During the latter pass, some binary telemetry was
received which showed the battery voltage rather low at 13.3 volts.
Nothing was heard on Wednesday pass at 05:46 UTC.

The shut down may be a recurrence of the watchdog timer problem, which was
prevalent about two years ago.

During the remainder of the reporting period (ie. 16-Feb-98 to 09-Mar-98),
good signals were received from the 145 MHz beacon. The battery voltage
has been slightly depressed at around 13.5 volts, but otherwise, telemetry
is nominal.

A single WOD survey has been transmitted, dated 06 January 1998. This
contains channels 10, 20, 30 ,40 (+Y, -X, +X array currents, and array
voltage). The array voltage is a very good indication of the solar eclipses,
changing rapidly as the satellite goes in and out of darkness.

Reception reports of the Mode-S beacon have been received from VK3BNC, N0ZHE, and N5JDB. All are using the Drake MMDS downconverter.

Clive Wallis, G3CWV, has created an OSCAR-11 Web site that contains information regarding the UoSAT-OSCAR-1 spacecraft. Clive recently added some audio files including a 20-second recording of the Mode-S beacon as received by KC6SZY. The other audio files are examples of each type of data transmitted by OSCAR-11, and each plays for about ten seconds. All the audio files are zipped so that they can be played off-line. They should help listeners identify the various types of data transmitted by the satellite, and give an indication of the signal quality required for successful decoding. The web site also contains some software useful for capturing data, and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis, which is continually being expanded, as new data is captured. The URL for Clive's OSCAR-11 Web site is:

http://www.users.zetnet.co.uk/clivew/

UoSAT-OSCAR-11's operating schedule remains unchanged:

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

There are also some additional status blocks transmitted after each bulletin between the ASCII TLM and WOD transmissions.

The Mode-S beacon is ON transmitting an unmodulated carrier, but telemetry indicates that it has partially failed, and delivering half power. This beacon is a useful test source for those testing Mode-S converters, prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing due to its stronger signal. Any reports of reception of the 2401 MHz Mode-S beacon should be directed to Clive Wallis at: g3cwv@amsat.org.

The 435.025 MHz beacon is normally OFF, but can sometimes be heard when the satellite is being commanded by ground control (ie. within range of Guildford, UK). When the 435 MHz beacon is transmitting, the 145 MHz beacon is normally OFF. The data transmitted is mainly binary.

[Info via Clive Wallis, G3CWV]

* ITAMSAT-OSCAR-26 NEWS *
==========
On 16-Mar-98, ITAMSAT Command Stations IK2XRO and IW2EGC succesfully switched the ITAMSAT-OSCAR-26 satellite ON from the safe MBL mode and reloaded the high level IHT97 code. The spacecraft is now sending the full set of 64 telemetry channels and is collecting Whole Orbit Data surveys. After the full check is completed, the digipeater will be turned ON, and the file

system code reload will begin. The satellite appears to be in an healthy
state, with all the subsystems working nominally. Telemetry can be copied
on 435.822 MHz at 1200 baud PSK.

[Info via Alberto E. Zagni, I2KBD - ITAMSAT (IO-26) Mission Director]

* FUJI-OSCAR-29 NEWS *
======================
The JARL has announced that the Fuji-OSCAR-29 communications satellite
was switched into Mode JA (analog transponder mode) on the pass of 16-Mar-98
at 0800 UTC. The satellite is expected to remain in Mode JA until 23-Mar-98,
after which a new operating schedule is expected to be announced.

[Info via Kazu Sakamoto, JJ1WTK]

* KITSAT-OSCAR-23 NEWS *
========================
Richard, G3RWL, has reported that the KITSAT-OSCAR-23 satellite is currently
experiencing a lack of solar eclipses that are causing the internal
temperature of the spacecraft to increase, resulting in a distorted downlink
signal. KO-23 goes through a period of where it experiences no eclipses
about every five months. Eclipses are expected to begin again around the
end of March or beginning of April.

[Info via Richard W L Limebear, G3RWL]

* CORRECTION TO REPORT ON JOHN GLENN *
======================================
Gordon West has confirmed that US Senator John Glenn did NOT attend his
Amateur Radio licensing course at Fry's Electronics in Southern California
earlier this month. A message was left for Glenn's press aide last week
asking if Glenn has intentions of talking on ham radio while in orbit,
either with a license or as a third party, and no response has so far
been received.

Source record: 16603

To first order Taurus is a "no go" for P3D. 8(

P3D is 2.24 meters in diameter. Taurus fairing is currently 1.6 m.
There is supposedly a plan for a 2.29m fairing, but that might wouldn't
fit P3D anyway.

P3D masses 630 kg. Taurus is rated at 450 kg to 28 degree GTO. P3D was
designed for a higher inclination and perigee too.

Taurus is about $US18-20 millions. With P3D massing so much it could be
the only payload. So there would be no one to subsidize the launch
costs. Taurus development is over, it is being called an operational
vehicle. No free demo flights...

Numbers are from Davidoff's "Satellite Handbook" and Isakowitz's
"International Reference Guide to Space Launch Systems."

I can never remember the mode numbers but it has uplinks on 145 and 21 MHz
and downlinks on 29 MHz. I think that is mode KA. Beacon at 29.408 MHz. It
works great. I worked about 60 QSOs in February before the passes got too
early in the day for me.

Good luck
Tom

638. Drake 2880 crystal change

Newsgroup: rec.radio.amateur.space
Date: 1998-03-24 00:00:00 UTC
From: "Greg D." <gregd@jps.net>
Message-ID: <3518A1BE.16D4@jps.net>
Source record: 16614

Hi,

I'm in the process of doing The Conversion of the Drake 2880 from MMDS to Amateur 2.4 GHz use. I have seen a number of modification paths, and have chosen an approach which I believe will work for my needs and equipment.

The plan is to move the Local Oscillator to 2.000 GHz, by getting a new crystal (7813 KHz). The received IF will be in the 400 MHz range, which is within the original unit's IF passband, and my Icom R-7000 scanner's receive range. The modification will also require a change of a capacitor in the PLL to 10pf to get things to lock.

My question: I have seen two different specs for the crystal on the 'net: 15pf load, and 24pf. I expect it makes a difference. Which one do I use?

Thanks,

Greg.

639. Arianne5/ESA

Source record: 16618

Hi Gang,

I have for sale 4 runs of Andrew LDF7 50 ohm 1 5/8" coaxial hardline.

3 runs of approximately 300' each. These were removed by a professional tower crew from a cellular tower. The coax was removed because the antennas were lowered from 400' to 100'. These runs have some red and white tower paint on them. They are all in good shape and are undamaged. The ends were sealed at the time of removal from the tower $2.00 per foot obo.

1 run of approximately 200' that is still on the reel and has never been used $3.00 per foot obo.

The boss said get rid of all that coax so it has to go. None of these runs have connectors. I'm located in Des Moines, Iowa and I would prefer pickup on all of these or I can arrange for shipping at the buyer's expense. I will accept Postal money order or cash.

Please email for more details if you like. Thanks and 73,

Al

Orbital's Taurus rocket is a ground-launched vehicle built on the strong heritage of the Pegasus program. The Taurus vehicle can deliver satellites of up to 3,000 pounds into low-Earth orbit; it was built to fill part of the performance gap between Pegasus and larger launch vehicles.

�Launch Date: March 13, 1994
�Customer: Advanced Research Projects Agency (ARPA)
�Orbital Insertion:
Perigee -- Target: 290nmi, Actual: 290.76nmi
Apogee -- Target: 293nmi, Actual: 301.19nmi
Inclination -- Target: 105 deg, Actual: 105.012 deg

That is all I have from the link Dr. Halliday fed me.

So what budget do we have to work with?

Christopher Cox

Hi, all,

I have misplaced my magazine article, I THINK it was in CQVHF, but not sure...about a 2 meter FM repeater satellite that was to be lanched about March 15th or so. Did it get launched, or was I imagining things?
Thanks,
Rick

Dr. Halliday? No. Not yet... :-)

You're not going to find this information on the web. You might start with books like the Satellite Experimenter's Handbook and Fundamentals of Astrodynamics, and then splurge on something heavy like Space Mission Analysis and Design. You can find bibliographic details on

http://mypage.direct.ca/v/ve7ldh/reading.html

(Or your local library. Or bookstore.)

With this kind of information you could, for example, analyze P3D's mission, had it been on board Ariane 502. I amused myself by making my own keps (news reports + educated guesses) so I could study ground tracks and such...

Budgets? Join AMSAT.

Jupiter's decameter radiation can be heard with a shortwave receiver
and a fairly simple wire beam antenna. It helps if you're in a rural location
away from urban noise sources, but it is possible in a backyard. Arrange
the antenna so that it receives mostly straight up. This will reduce most
terrestrial noise and interference. (See ARRL Antenna Book for wire
antenna patterns.) Tune across the 18 MHz to 22 MHz area when Jupiter
is overhead and listen for what sounds like surf crashing on a beach. That's
Jupiter. (Actually it is the flux tube between Jupiter and one of its satellites
interacting with the strong local energetic particle belts around Jupiter.)

I don't think you can hear the inner planets (other than Earth of course)
on a minimal budget. They are fairly radio quiet. You can hear the Sun
with a good VHF/UHF array (or dish) and suitable preamp. Listening
for Sun noise is one way weak signal operators check out their systems.
Sun noise sounds like bacon frying.

You can listen to Earth at ELF. This is called by some "natural radio".
There is a huge array of different signals, from whistlers to the dawn
chorus, which you can receive with very simple equipment. Again
you need to get into a remote location away from urban noise,
particularly power line noise, in order to hear this. All you need
is a voltage probe antenna and a sensitive TRF receiver (basically
nothing but a very high gain audio amplifier fed by a FET follower
with a voltage probe on its gate).

Check out

http://members.aol.com/warmspgs/natrad.htm

for more info on natural radio.

So, troll, what are you going to do about it?
Pay full price for a commercial launch?
Hope your pockets are *really* deep.
If we can't get a nearly free launch
from ESA, we don't go. It's as simple
as that.

There's no way AMSAT can raise
the money for a commercial launch.
None. ESA has agreed to give us a
ride, when available, as they have
many times in the past. We'll just
have to wait. If you don't like that,
tough.

Schedules slip, even for the high
roller paying customers. Hubble
had to sit on the ground for years
beyond its planned launch date.
Cassini did too. There was a
14 month period when the US
Air Force couldn't get any of
their satellites launched. That's
the way it is. The space launch
business isn't a railroad. Learn
to live with it.

None of which even comes close to putting 450 kg into
a 63.4 degree inclined Molnyia orbit (that's an apogee
of 47,000 km and a perigee of 4,000 km). The delta V
needed to get from LEO to GTO is considerable. It is
well beyond the capabilities of P3D's kick motor, which
is just enough to shift the plane and raise perigee out
of the atmosphere and up to final orbit over a period of
2 years (it obviously isn't burning all that time, we wait
for precession to do some of the work for us), plus a bit
of reserve for stationkeeping.

We need a launcher at least on the order of an Ariane 4
to achieve our orbital objective. That's the same class as
a US Delta 2 or Atlas 2, or the Russian Proton, or the
Chinese Long March 4. An Ariane 5 is roughly in the class
of our Titan 4, our heaviest lift rocket. It is overkill for our
needs, but we were to be a secondary payload on it.

A Pegasus or Taurus might do for one of our LEO sats,
but they aren't in the running for a Molnyia orbit bird. That
takes more oomph than they can muster. And they still
cost more than we can afford.

>So what budget do we have to work with?

Total budget for P3D, including hardware, integration,
launch campaign, and launch fee is roughly $5,000,000.
And 4 years into the program we're about $200,000 short
of that goal (and every delay raises the final cost due to
having to keep the Orlando facility open). The launch fee
(already paid) is on the order of $370,000 (basically we're
just a hitchhiker splitting the gas bill). Commercial GTO

launch costs average about $24,000,000. Begin to see
the magnitude of the problem?

If we don't fly Arianespace, we have a shortfall on the
order of $23,600,000. With a roughly 4,000 active member
AMSAT, that works out to about $5,900 a head to pay
for a commercial launch. When should we expect
your check?

That's why we've flown Arianespace rockets 15 times.
They've been willing to give us a huge break. No one else
has. So I get really sick and tired of seeing people bad
mouth them. General Dynamics and McDonald Douglas
won't give us that sort of break.

The Russians have given their amateurs several rides,
but they're cash strapped now and looking for paying
customers. I don't see any help from that quarter, though
a ride on a Proton would be lovely. That's the most reliable
launcher in the world.

The Chinese have been killing peasants with their kamakazi
Long March's lately, so we really don't want to risk a several
million dollar satellite with them even if they were willing to give
us a break. Japan does have a Delta derivative that would do,
but I don't see a big price break from them either, and their
launch rate is really low.

So we have to fly stand by with Arianespace, and wait longer
than we expected to wait. That's better than having no chance
to fly at all. Patience, Arianespace will find us a ride. They
always have.

661. For Sale: L.L. Grace DSP 12 "Satellite" TNC

Newsgroup: rec.radio.amateur.space
Date: 1998-03-29 00:00:00 UTC
From: Dale Yost <dyost@marketing-support.com>
Message-ID: <351E6FBD.116@marketing-support.com>
Source record: 16637

Hi,

FOR SALE: For ham radio enthusiasts, this is the "ultimate" TNC. Hook this up to your rig (even a handie-talkie!) and your IBM-compatible computer and you can easily connect to your favorite local land-based packet radio stations. But this TNC can also let you do a whole lot more--including experiencing the thrill of communicating with any of the many amateur radio satellites, certain (ham operator on-board) Space Shuttle Missions, even Russia's MIR
space station!

The DSP-12 replaces the traditional analog modems of cheap TNCs with a Digital Signal Processor (DSP) CPU! It's fully programmable.
Handles the specialized packet protocols of WEFAX, RTTY, ACARS, plus the OSCAR (Orbiting Satellites Carrying Amateur Radio) satellites. Works
with
HF Packet, RTTY, and ASCII; VHF/UHF packet; plus the capabilities you need to work the satellites: 400-bps PSK, 1200-bps PSK, 9600-bps direct FSK--plus six PSK speeds from 75-1200-bps. And since it has a computer CPU, it can be programmed with software upgrades to handle new technologies/protocols as they're introduced.

This immaculate unit cost me over $700 new. Comes with a very thorough manual--plus Satellite Tracking software (Looks better than NASA's on-screen), plus cable to connect to your computer's serial port, and TNC software. For best offer over $350, I'll include a power supply unit and books on satellite communications to get you going.

The most responsive thing for AMSAT members (and non-member satellite users) to do would be to pony up some donation money to meet the shortfall, then lobby AMSAT to build a smaller interim mode B satellite for contingency purposes (for an earlier launch opportunity or P3D back up). Then donate more money (or time).

Well, the US government quit letting us hitchhike 20 years ago. Arianespace
has been the only game in town since then. And the only commercial space
operation to ever do so.

NASA's participation through SAREX and the upcoming international
space station is, of course, welcome, but having the gascan lid slammed
on us has virtually eliminated NASA as a way to get our own free flying
satellites into orbit for the last 20 years.

What do you think the odds are of us hitchhiking on one of the upcoming
X flights? I'd venture somewhere between slim and none, though I'd like
to be wrong about that.

I expect any GTO opportunity will have P3D on it. There's no reason
to launch anything lesser, and it wouldn't open up any slot that P3D
couldn't fill.

However, there is currently no follow on to P3D. All of AMSAT's
resources and energy have been directed toward it. Now would
be a good time to think about what we want to do after P3D. Do
we really want to fall back to an Oscar 10 class satellite? I don't
think so. We've done that, and P3D will do it much better.

Logically, the next step would be a phase 4 geosync constellation.
But considering that even one of those would cost much more than
P3D, and face an even greater problem of finding a ride, perhaps
we might consider a different direction.

We've done Little LEOs. We've done microsats. We've done
the Molnyia thing. We can't afford the GEO thing. So what
directions does that leave?

Something in LEO gives us the best chance of hitching a
ride. But what can we do there that we haven't already done?

Something much further out is a longshot, but interesting.
Tenative plans were made for lunar or Mars activities
piggybacked on the original P3D concept. Perhaps one of
those might be feasible as a standalone program. A tiny
lunar orbiter would be neat, and Lunar Prospector shows us
that we could hear it. If we could get a ride to LEO, we could
put a microsat size payload into lunar orbit with a kick motor
small enough to get carried up with it. If we didn't get carried
away fixating on repeaters in space, we could probably do it
pretty cheaply too.

My vote is to try something innovative with our next effort
and not to just keep doing the poor man's comsat over and
over.

The early OSCARs were secondary payloads on research missions, but
the ESA/Arianespace launches are courtesy a commercial organisation,
who sell space access. A very different sort of animal.

I wonder why those who generalised the Ariane 501 launch failure
to general incompetence in Evry were not subject to the same
scrutiny?

How about a bunch of intelligent LEO's repeating to each other forming a continuos world net? Sound intriguing and doable to me. Less cost, more opportunity. Sort of a wide area repeater network in orbit.

BTW, Hi Gary, long time. How the DSP project going.

Regards

Christopher Cox

"WAY low" is meaningless - apogee and perigee, please, planned and
actual. What delta V would have been necessary to put P3D in its
intended orbit from the orbit provided by Ariane 502? How does this
compare with P3D's delta V capability?

> I belong, but all I receive is how far they are in the hole, nothing

Dunno. Gary and I seem to know the numbers, and *I'm* certainly
not an AMSAT bigwig. Therefore, the numbers are available.

On our budget, we're probably better off lining up a launch first,
and then designing a satellite around it. The mass, volume and
orbit will determine what we can do. This sounds remarkably like
our current ESA/Ariane 5 dealings, come to think of it.

We can build satelites. We cannot launch them without (expensive)
help from others.

670. Re: ESA got a Phase 3D launch for AMSAT yet?

Newsgroup: rec.radio.amateur.space
Date: 1998-03-30 00:00:00 UTC
From: Cathryn Mataga <ke6i@junglevision.com>
Message-ID: <352081B9.BCA9D5DB@junglevision.com>
Source record: 16646

Well, if we're talking fantasy satellites, here. I'd like to
see a big camera up there -- where individual hams could
queue up requests for pictures, and then download them
after they're done. That way we could get aerial shots
of the local area -- snoop into Saddam Hussein's palaces
and stuff. It'd be cool, imho.

You know, I'm not so sure the smaller is really better. I wonder
if there's a chance they'd go for a smaller satellite and still
have a rough time getting that one launched. Maybe it's just
not going to be easy no matter what. I looked at the website
for the Stanford satellite which looks to be going pretty good.
And still, you know, it doesn't look easy big or small.
Maybe that's part of why I find it interesting.

What about making a second P3D? Using exactly the same boards
and plans. If this design has been through all the testing, why
start from scratch again.

....

My thinking is that for a satellite to be a success in the ham
radio world, there's got to be something 'to do' with the satellite.
With the analog satellites you can try to work grid squares or
states.

The question I'd ask, and I know this may sound silly, is what
kind of contest can you run on the thing? If there's some kind
of operating contest that could be designed, I think you'd get
a lot of interest. This would, of course, be somewhat different
from HF, since you don't want people to get too type-A and jam
the satellite with big amps. But, then maybe using lower power
-- that would be the contest.

You know, seeing that guy from Antarctica who operated KO-23
from down there got me thinking that maybe it would work to
have a contest for how many countries or grid squares you could
upload messages to Pacsats from? The ingredients here being
that sitting in a tent in the middle of nowhere working a
a satellite is a cool thing, and it's difficult enough to
be a challenge. It involves the, err, romance of exotic
locations, etc. So that could be a contest.

It doesn't have to be DX, though that's the standard ham
radio thing. After all, they make a contest out ice skating,
where judges have peculiar standards of perfection. Maybe

judges evaluate the 'perfection' of the operating technique.

My usual gig is that I'm a computer game programmer. So, I sit
around and think about making things for people to do all the
time. That's where I'm coming from. In a computer game, what you
do is completely invented by the programmers. What is the challenge
of playing -- or operating? If it's too easy, then I think of
something that's harder to do.

I got my FT847 Saturday the 29th of March. It is WONDERFUL!
The DSP unit in it works better than my Timewave 59+ did, and the sat performance
puts my IC-820 to shame both in ease of operation (The 820H was a pain) and in performance. Very low noise floor, and even the internal preamp for UHF was very low noise. I think I'm gonna like this one.

673. TOROID INDUCTORS

Newsgroup: rec.radio.amateur.space
Date: 1998-03-31 00:00:00 UTC
From: toroids@aol.com
Message-ID: <1998033103440101.WAA14786@ladder01.news.aol.com>
Source record: 16649

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...
Down load a demo or just view the software main screen at our web

674. NORAD Two-Line Orbital Element Sets (TLE170)

Newsgroup: rec.radio.amateur.space
Date: 1998-03-31 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <6fpptp$2so$1@blackbird.afit.af.mil>
Source record: 16650

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* CelesTrak WWW:

http://celestrak.com

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space. This site, however, will no longer be available after 1998 March 31.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

One idea would be for another AO-27 FM satellite.

Another would be for an ATV repeater (not SSTV, although that might be
tried).

It didn't take much effort to get Oscar 1 up there. I'd like to see
AMSAT do a whole bunch of little 1 kg, limited lifetime xmitters,
and get them on anything and everything going up that we possibly can.
The contest would be longest reception for anything leaving earth orbit.
For those in earth orbit, the power would drop as the batteries died,
thus providing weak signal contests.

In 1960 the ECHO satellite, a huge inflatable reflective sphere was launched. A few similar passive satellites followed. I am no radio amateur, just curious whether radio amateurs made any contacts via this satellites and if not, whether it would be possible by todays amateur equipment. Would both stations have to track the satellite with their antennas ?

We need to think "out of the box" a little more on this issue. Have we tried talking to the commercials about placing small, light, single transponders on board the commercial geo-birds. Seems like for the price of a launch ($1M) we could get them to at least talk about a 10 kg package on board one of the comsats. According to AMSAT, its never been

tried, or even discussed with any commercials.

Another alternative we might think about is to design an MEO. Turns out that a sat from 5000 to 10000 mi high, nearly circular covers half of the earth, and doesn't require nearly the transponder power of a molynia orbit sat. The only concern here is the van allen belts. I haven't seen any studies on the launcher requirements for this.

I think the thing to remember is that if the average ham is going to put out some of his hard earned treasury for a space project, it has to be usable by him personally, without building the VLA in his backyard.

Let's hear some more ideas that we can pass along to the AMSAT Board for discussion and study.

That's basically the picosat project, with a big dollop of in-space
routing and switching added. I'm dubious about that, but I'm game
to consider it in a bit more detail. The management software should
be interesting.

>BTW, Hi Gary, long time. How the DSP project going.

The DSP receiver has been a done deal for quite a while now.
It works nicely. I've stopped further development on it. That
would just be gilding the lily. (Though the QST article with
the Motorola eval board has me thinking again. It has a better
dynamic range than my Analog Devices board.)

My attempt to port the concept to pure software on my multimedia
laptop is making a bit of progress. I finally licked the problem of
moving the data in and out of the SB chipset without corruption
that had been stalling me. I found a SDK for the SB on the Microsoft
site that got me straightened out in that department.

I'm working on improving the efficiency of the processing routines
now. My laptop is a plain jane 120 MHz Pentium without the MMX
extensions, so I can't use the hardware speedups available to MMX
machines. And I'm trying to stay in a HLL (C++) and avoid having to
drop to assembly. And I'm trying to work in a Win95 environment.
That's tough, especially the latter, but it is improving my understanding
of how C++ compilers "optimize", and increasing my loathing for how
Win95 deals with complex realtime tasks. Programming DSP chips
is lots easier. :-)

This idea has been kicked around on amsat-bb before. Apparently, a limiting factor for operating lifetime of a commercial geosat is the amount of propellant it can carry for station keeping. When it's propellant runs out, then it's usefulness nears an end.

Therefore, a 10 kg package on a geosat equates to 10 less kg it can carry as stationkeeping propellant.

However, if you don't ask, you'll never know.

I wonder if the Russians would let us piggyback a transponder on a GLONASS satellite? They sure have put a lot of RS birds in orbit over the last coupld of decades.

I understand they are falling behind on their GLONASS launches, though I don't know if this is due to launch opportunities or getting the birds ready. Maybe if AMSAT offered to build GLONASS birds according to spec, it might "grease the skids" a little bit. Security might be an issue, however.

I certainly agree to this as I was there and witnessed the god-awful
effort that it took! Apparently none of the present day hams have a clue
the months of technical effort and political prowess needed the put up
this "simple" set of satellites that OSCAR's one through six required!

Hmm, make a satellite that generates a pseudorandom sequence at
various power levels. Then every weekend, everyone would try to decode
the sequence as it passes over them. Then, the match the sequences
everyone gets versus data found from the original key.
I can see that.

The trickiness, of all this is that you want an easy entry point.
So, it's relatively easy to get started but that there's some kind
of challenge if the users get more involved. It's not just making
it easier -- it's got to be easy at the start, and a challenge
for the committed people.

The subject says it all.

Just picked up an IC-211. Looking to see what others think of it.

Plus I am looking for a manual as well as a service manual.
Can anyone photocopy one?

BTW: has anyone had one of those Mutek ltd. replacement boards
installed (RPCB 251ub I think..) in their IC-211?

What diference did it make?

My father was a ham, and I remember him tuning in Sputnick. I'd think
if QST had anything about amateurs using Echo, he would have been doing
it, because we sat in the backyard _watching_ Echo. I don't remember
which one. I believe they were intended for the Navy to do communication
signal bounce tests.

I remember the Oscars, _listened_ to them, and have read everything I could find about them. Nowhere have I seen any mention of "god-awful effort" for Oscar 1. The story told is that they just asked around until they found a ride.

If you've got a different story to tell, I'd like to hear it.

692. PSK decoder Kits ?

Newsgroup: rec.radio.amateur.space
Date: 1998-03-31 00:00:00 UTC
From: Paul Bigwood <bigwoodp@kbcomms.demon.co.uk>
Message-ID: <891460468.21150.0.nnrp-06.9e983d0c@news.demon.co.uk>
Source record: 16668

Hi, I've just got interested in sats and was wondering where I could get some
information on PSK decoders (ccts or kits or ready built) for decoding telemetry from some of the satellites.

I've got an AMSAT book on decoding telemetry, which is interesting but it doesn't go into much detail about the hardware required to decode the telemetry.

Any help appreciated

There is a special N connector for 9913, but I forget who makes it. I
have used the crimp version, but the basic difference was that it was
for a smaller outside diameter.

694. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1998-04-01 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <6fsbji$153$1@blackbird.afit.af.mil>
Source record: 16670

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* CelesTrak WWW,

http://celestrak.com

and are updated daily (when possible). Documentation and tracking software are also available on this system. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from

archive.afit.af.mil (129.92.1.66)

in the directory pub/space. This site, however, will no longer be available after 1998 March 31.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-four character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01 Line Number of Element Data
03-07 Satellite Number
08 Classification (U=Unclassified)
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Day of the year and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
45-52 Second Time Derivative of Mean Motion (decimal point assumed)
54-61 BSTAR drag term (decimal point assumed)
63 Ephemeris type
65-68 Element number
69 Checksum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69 Checksum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 14
1 23455U 94089A 97320.90946019 .00000140 00000-0 10191-3 0 2621
2 23455 99.0090 272.6745 0008546 223.1686 136.8816 14.11711747148495

"Richard L. Tannnehill" (rickw7rt@firstinter.net) writes:
We need to think "out of the box" a little more on this issue. Have we
tried talking to the commercials about placing small, light, single
transponders on board the commercial geo-birds. Seems like for the
price of a launch ($1M) we could get them to at least talk about a 10 kg
package on board one of the comsats. According to AMSAT, its never been
tried, or even discussed with any commercials.

Another alternative we might think about is to design an MEO. Turns out
that a sat from 5000 to 10000 mi high, nearly circular covers half of
the earth, and doesn't require nearly the transponder power of a molynia
orbit sat. The only concern here is the van allen belts. I haven't
seen any studies on the launcher requirements for this.

ae517@FreeNet.Carleton.CA (Russ Renaud)
I wonder if the Russians would let us piggyback a transponder on a GLONASS
satellite? They sure have put a lot of RS birds in orbit over the last
coupld of decades.
I understand they are falling behind on their GLONASS launches, though I
don't know if this is due to launch opportunities or getting the birds
ready. Maybe if AMSAT offered to build GLONASS birds according to spec,
it might "grease the skids" a little bit. Security might be an issue,
however.

geosynq@tcon.net
I'd like to see
AMSAT do a whole bunch of little 1 kg, limited lifetime xmitters,
and get them on anything and everything going up that we possibly can.
The contest would be longest reception for anything leaving earth orbit.
For those in earth orbit, the power would drop as the batteries died,
thus providing weak signal contests.

Cathryn Mataga <ke6i@junglevision.com>
Hmm, make a satellite that generates a pseudorandom sequence at
various power levels. Then every weekend, everyone would try to decode
the sequence as it passes over them. Then, the match the sequences

everyone gets versus data found from the original key.
I can see that.

696. MIR UHF RX with handheld ???

Newsgroup: rec.radio.amateur.space

Message-ID: <35227BCA.E38@wanadoo.fr>
Source record: 16672

I've read somewhere in this newsgroup that it was possible to hear MIR on its UHF downlink frequencies with a simple handheld and a rubber duck.

I tried it yesterday and, though I was able to receive packet 59+ on 145.985, nothing heard on UHF...

Any comments ?

Thanks in advance from Laurent TK5ML.

OK, like I'm not saying they should rush out and do this, though I
think it might be fun for some people. I call it QROscar. I was thinking
about all those guys with Kwatts trying to get into Mir. Obviously,
it's disruptive there. But, who says that using the lowest power is
always the best. I was thinking that there could be a satellite where
the idea of the thing is to pound the receiver with as much RF as
is legally possible for hams. And, the thing would report back
on another channel what the results are for that day. It'd have an
S-Meter that was able to accurately record the strength of each signal,
and we'd all know for the last week or so who hit the bird with the
most powerful jolt. Sort of like carnival strength machines. People
who build their massive dishes and big scary microwave amps could prove
to the world who is truly the biggest gun.

699. Noise Figure vs. deg K formula

Newsgroup: rec.radio.amateur.space
Date: 1998-04-01 00:00:00 UTC
From: notmbv@airmail.net
Message-ID: <6fu3mlhjg1@tilde.csc.ti.com>
Source record: 16675

Is there a formula to compare NF to deg K? if so, please send it to me
or tell me where to find it on the net.

Thanks, Ken K5MBV

700. List of the rec.radio newsgroups (brief)

Newsgroup: rec.radio.amateur.space
Date: 1998-04-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6fs8dh$6d9@news.Hawaii.Edu>
Source record: 16676

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and the contents of such a thread drift further and further away from being "on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

I'd say it's about 50% joke. Really the idea just popped in my head
when I saw the propmpt. I got a few other emails from people
who seemed almost, disturbed, by the suggestion. So, maybe it's
not so popular among the gallery here. I do believe
a little bit of type-a-competitive-insanity, properly channeled, can
put a little edge on an activity. I can see that pounding an S-meter
on a satellite is a crude a test of 'transmitus maximus' without much
subtlety. Whereas even on HF, there's a bit more to working
DX than just having massive antennae -- though that makes a difference.

The transmitter test does kind of partially fulfill some of my basic
criteria for an interesting competition though. And, that is it has
a easy beginner level. You tune up the frequency on your HT and
squeeze the PTT button. Then, listen back on another channel how
strong you were. Whereas if you really want to win -- well, I think
we all know where this one goes. It's an engineering challenge --
though not much of an operating challenge, I think. That's where it
fails -- a bit. In that there's not much to do once you've melted
the S-meter a few times.

All that aside, the issue is, "What is the goal of a ham satellite?" And, I put it to the group that one goal is that the thing should be 'fun to operate.' And, if you dig a little bit into the meaning of 'fun', I think you'll find that some kind of competition is often involved. As long as there's some level 'good sportsmanship' involved, I don't see anything wrong with this.

Though I'm completely willing to go with the notion that competition isn't the end all. The goal could be a matter of being 'technologically interesting'. Or perhaps 'fascilitating communication'. Those are reasonable things also.

I liked mine. The stock radio has a pretty dismal noise figure,
but the Mutek board fixes that. It doesn't have provision for
narrow filters or passband tuning like newer radios, so an
aftermarket DSP box can be useful. But otherwise I liked
the way it worked. (I used it for Oscar 10.)

>Plus I am looking for a manual as well as a service manual.

There was no separate service manual, but the owner's manual
doubled nicely as a service manual in the tradition of most older
amateur gear. I'm sorry to say that sort of manual has become
a thing of the past.

>BTW: has anyone had one of those Mutek ltd. replacement boards
>installed (RPCB 251ub I think..) in their IC-211?

>What diference did it make?

I put one in mine. It made a *dramatic* difference in the weak signal
performance of the radio. It brought signals that were buried in the
receiver noise up to armchair copy. This board is a must for any
IC-211owner who wants to hear weak signals. It puts the radio on
a par with the much newer IC-275 in terms of noise figure (but the
IC-275 is still nicer in other ways, that's what I have now).

This formula may be more than I am looking for. What I would like to be able to do is compare KU band LNB NF to C band deg K using the same units of measurement. For instance: What deg K LNB is equivalent to a .6db NF LNB?
Antenna temperature is constant and there is 0 line loss at the LNB. The bandwidth is 500MHZ in both cases.

Thanks, Ken K5MBV

709. USAF Academy request for info

Newsgroup: rec.radio.amateur.space
Date: 1998-04-02 00:00:00 UTC
From: Brian Mork <mork@usa.net>
Message-ID: <35243E4E.4E95@usa.net>
Source record: 16540

Hello. I'm the OIC (Officer In Charge) for
the K0MIC USAF Academy radio club.

We're putting up a 2M/440 satellite chasing system
at the club station, and have a few questions.
Can you help?

I'm looking at Cushcraft, Hy-Gain, and KLM
antenna pairs. Which model would be best?
What little hardware
or accessories am I likely to forget while
flipping through catalogues?

We use a duplexer out the back of our IC-821,
to run just one feed line out to a dual band
vertical. For satellite work, can we still
run only one coax? Can we use mast mounted
pre-amps and amplifiers? Should I plan to
mount pre/amps after the splitter at the
antenna, or does anybody make a dual band
preamp/amplifier?

We're looking at the Yauesu 5400 az/el rotor.
Do I have to buy the $450 '232 controller
for this rotor?! Can I use InstaTrack and
a Kansas City Tracker to control the antennas?
What combination do you suggest?

What tower options are best? Radio Shack
sells a $14.95 3-foot tripod, and $13 10-foot
sections of mast. With a 19' boom on the
2-meter, I'm figuring I need the rotors
about 10' up. AES sells some $300 quad-pod
supports. Or how about a 10' top section
of Universal Tower's tower design?

Lastly, anybody have about 300' of hardline
they'd like to donate?!

Thanks for any ideas you have, and if you
have a chance, stop by the web page at
qsl.net.

Cathryn,

I hope your post was a sick April Fool's joke ... otherwise,
please, please, please don't encourage MORE of the "my ___'s
bigger than yours" macho, king of the hill, powermonger crap.
We have More than enough already ... and the *FCC* says that
using the lowest power possible is always the best (it's the
most widely violated ham rule in existence, I'm sure).

Ken,

The formula: F = 1+(Tr/To)

where Tr = receiver noise temp in Kelvins
To = 290 K
and F = noise FACTOR of receiver (power RATIO, not dB)

will get you there, then all you have to do is to
convert the linear ratio F to noise figure in dB,

so (Noise Figure in dB) = 10LOG(1+Tr/To))

also, the effective noise temp of a receiving system
is

Te = Ta+(LF-1)To

where Ta is the noise temp of the antenna system
To is (still) 290 K
L is the transmission line loss (power RATIO, not dB)
and F is (still) the noise FACTOR of receiver (power RATIO, not dB)

and (Noise Power in dBm) = -198.6+10LOG(B)+10LOG(Te)

where Te = effective noise temp in Kelvins
and B = bandwidth in Hertz

Hope this helps,

Communication by amateurs at the power levels allowed were not
successful, however military comms worked but at very high powers. Echo
2 was scheduled for launch in 1962, and was bigger and lower, and looked
promising for amateurs. However, it wasn't launched until 1964, and by
then both government and amateurs had tested active relay satellites.
These worked so well the Echo program was killed, although well setup
ham stations did get weak signals from Echo 2. Project West Ford was in
the pipeline to orbit millions of needles for the same purpose as Echo.
Info from The satellite Experimenter's Handbook.

Yeah, it's the same board. There is also a board for the IC-271 (different).
I got mine direct from Mutek, but I notice that SSB Electronics USA is also
a distributor. They still list the board for the IC-211/IC-251 on their webpage,

>>>>>>>>>>>>>>>>>>>> <<<<<<<<<<<<<<<<<<<<<<<

I once owned an IC211 way back when they were a new radio. I used it
for weak signal work. Yes, it REQUIRES a good preamp. Now, let's talk
transmitter, mainly, the synthesizer. Using the radio for weak signal
work, I had a pair of 4CX250B's on its output when needed. They have a
gain of just over 20 dB (biased properly). I could never understand why

other hams in the area (radius of roughly 50 miles) complained of "birdies" every 10, 5, . . . kHz (even, heaven forbid, outside the band). The birdies were weaker by the gain of the "afterburner" when it was out of the circuit, but they were still there. Well, it turns out, the IC211, contrary to popular belief of the time, was just another FM radio with SSB and CW tacked on for good measure (and price). On the narrow bandwidth modes, Icom did NOT shut off all the frequencies the synthesizer used to accomplish the smallest tuning step on FM. Even though the narrow band modes did not use them, whenever some gain was "attached" to the output of the transmitter, all these "PLL" frequencies were amplified as well. And, remember, if it is there on transmit, the PLL also serves as the receive LO, and will admit all the "stuff" on the "birdie" frequencies as well as the main LO frequency, like LO noise. If you want the radio for FM, it gets a qualified "OK". But for SSB/CW and general weak signal work, continue to look.

* NEW SPUTNIK PLANNED *
======================
The spare Sputnik satellite that was delivered to Mir along with the Sputnik
model that was deployed from Mir late last year is expected to undergo an
upgrade and be deployed from Mir in the latter part of 1998. The upgrade
will consist of replacing the battery and control boards, and install
circuitry that will allow the satellite to make voice announcements in
French, Russian, and English.

[Info via Miles Mann, WF1F]

* OSCAR-11 UPDATE *
==================
After ground control operations that took place during the third week of
March, the 145.826 MHz VHF-FM beacon is now transmitting normally. Strong
signals have been received from UoSAT-OSCAR-11. Telemetry shows that the
S-band beacon is ON. Telemetry also indicates that there is a reduction
in the 14 volt line current of about 50 mA and a reduction in the +5 volt
current of about 25 mA. The reason for these changes is not widely known.

A new WOD survey of channels 1, 2, 3, 61 (magnetometers) dated 19-Mar-98
has been started. Anyone using this survey should note the unusual starting
time of 16:00:05 UTC.

[Info via Clive Wallis, G3CWV]

* TECHSAT LAUNCH NEWS *
======================
Speaking on behalf of AMSAT, Shlomo Menuhin 4X1AS announced that at long
last (barring any major difficulties) the Israeli Amateur Radio TECHSAT
II produced at the Technion University in Haifa will be launched in late
April or early May 1998. The satellite will sport a packet radio store

and forward mailbox operating at 9600 baud. The satellite will be
launched from Kazakhstan, and Shlomo will be on hand to represent AMSAT.

[Info via Assi Friedman, 4X1KX/KK7KX]

* STS-90 ORBITAL DATA *
=======================
The nominal orbital data for STS-90 was posted on the AMSAT web page at:

http://www.amsat.org/amsat/sarex/orbit.html

STS-90 is scheduled for launch on 16-Apr-98 at 18:19 UTC. Based on this
launch date and time, the following Keplerian elements were computed from
a nominal NASA state vector:

STS-90

* MIREX FILTER PROJECT ARRIVES ON MIR *
=======================================
The Progress 38 cargo rocket that arrived at Mir in mid-March delivered the
new MIREX-DCI antenna filter to the Russian Mir space station. The filter
will be used to prevent interference from a commercial VHF-FM transmitter
on-board Mir from affecting the sensitivity and performance of the 2-meter
packet radio station on-board Mir. The MIREX-DCI filer is a custom designed
antenna cavity filter that will block the offending signal with a combination
of passband and notch filters. The filter system is tentatively planned for
installation in the April/May time frame.

The MIREX team would like to thank all of the supporters of the filter project,
including DCI Digital Communications, Inc, SAFEX, and the SAREX Working Group.

MONDAY APRIL 6, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* MIREX SCHOOL DAY TEST PLANNED *
================================
To permit maximum participation by schools and students in a joint MIR
communicatons experiment, the MIREX team has authorized a special MIREX
School Day test on April 27th 1998 between 1000 and 2300 UTC. The purpose
of the test is to improve the understanding of students about the Space
Station and demonstrate the factors involved in space communications using
amateur radio. Of the many schools to participate, even schools for the
deaf and disabled will be able to experience the event through their
computer displays.

There is no limit to the number of stations that can participate, since any
amateur radio station at any school in the world may monitor the downlink of
the test. All stations will be able to capture and log communications from
both MIR itself and the other schools authorized to transmit. Due to the
limited capacity on the uplink, however, the number of stations authorized
to transmit will be limited to under 100 per footprint area. In general,
only schools and other youth group demonstrations will be authorized to
transmit. For planning purposes, schools intending to transmit should
send Email to wb4apr@amsat.org including the following brief information:

1) Callsign and Point of contact
2) School Name or affiliation
3) Number of students that might participate
4) Equipment used at the School (power and antenna type)

After the test, the MIREX team would like to hear about any media coverage
or any interesting observations or special events at your site.

To allow the maximum probability of success on each orbit, schools will
transmit via UI frames and the experiment will proceed in phases. As each
phase is successfully accomplished, then additional complexity may be added

to the experiment. This phased approach makes sure that everyone gets an equal chance of success without congestion while allowing for additional capacity if it exists.

The MIR packet system will downlink a brief BULLETIN once every 3 minutes. Each school should expect to capture these bulletins at some time during the pass.

Concurent with the Bulletin Phase, the next objective is for each transmitting school to successfully relay a position/status report via MIR and for all other schools to receive them. A position packet will look something like this:

W3ADO>GGggGG,R0MIR*:]k[US Naval Academy. 75 Students 35w. Hi MIR!

Here, the GGggGG is the stations grid square which is sufficient to locate the school to within about 3 miles. The]k[is the map ICON for a school. Stations may transmit these single packets at about a one-a-minute rate until successful. Once they see their position in the downlink, then they should stop sending their position.

After each school has captured one full page of position packets (16 stations) from other schools, indicating others are being successful and their station is hearing the downlink, then the authorized schools may send a single message packet to any other station. For each additional page of 16 positions that each school captures, it may send additional packets up to a maximum of 5.

A special version of packet software called MIRMON has been donated for unlimited use during this experiment. MIRMON will capture all position reports, bulletins and messages and give schools a consistent display of the event. The software may be downloaded and further test details as well as a replay of the last such experiment are available on the Naval Academy MIREX WEB page at the following URL:

http://web.usna.navy.mil/~bruninga/mirex.html

Schools with at least a 2m FM 25 watt transceiver, an omni-directional antenna, and a conventional TNC should be successful. Individual hams wishing to participate are welcome to monitor the test in RECEIVE ONLY, or to visit a school and set up a demonstration to qualify to transmit. This means all stations should be manned and not operated unattended.

Even schools without current ham radio equipment can monitor the event via the live Web pages above and also at www.mirex.net. The MIREX Team is trying to find dedicated ground stations, at least one per continent, that can link their receiver to a growing MIREX network. Currently there are feeds in the Eastern USA, Mexico, and Spain under construction. To see the combined feed from these stations, browse the web site above or telnet to www.mirex.net. For school info contact Bob at: wb4apr@amsat.org.

This question is answered best by geometry. If the wavelength is small enough, then the focal point is just that - a point. Consider first that the dish were the parapet of an open umbrella. The focal point will lie along the shaft of the umbrella. So where along that line is the focal point? Take a long broomstick and steady it in the parabolic dish such that it is like the umbrella shaft. Make sure it does not lean to any particular side, but that it is perfectly symmetrical with the parabolic dish (use equidistant strings to the bowl edge.) Now take a piece of electrical tape and run it along the inner surface of the dish from its center to some point on the edge of the bowl (as though if the dish were facing the sky's zenith and the sun were out, it would cast a shadow by the broomstick onto the dish such that it would look like the electrical tape at some distict time of day.) Set the dish such that it is pointed at the true zenith by using a level (ie with bubbles), the dish being correctly pointed when the direction of the symmetrical broomstick is perfectly vertical (as read by the level.) With the dish and broomstick steady in an upright position, consider some horizontal line in space between the electrical tape and the broomstick (the level bubble for horizontal would be perfecty centered if held along this imaginary line.) The correct horizontal line is the one which has the following property: The horizontally level distance from the point on the broomstick to the electrical tape is exctly twice the distance from that point on the broomstick to the base of the broomstick (which connects to the dish.) That point on the broomstick is the focal point.

Well then, it does matter - put the dish in the backyard, so all that
sloshing around does not mess the house up. Yes, the backyard is where
the cats dish should go.

But will the performance of the cat, and of the dish, be affected by the
weather? What about storms? Will Kitty starve?

>tried, or even discussed with any commercials.

It is certainly worth discussing, but realize that every kg of parasitic mass is a kg less station keeping fuel for that $100 million GEO comsat. It is basically station keeping fuel which limits the lifetime of those very expensive satellites. I haven't seen hard numbers on the lifetime impact of a 10 kg reduction in station keeping fuel, but I suspect it is more than 1%.

And that parasitic package is unlikely to be able to have its own antennas on the despun part of the comsat. It would have to piggyback on the comsat's own antenna systems. And that raises EMC issues which would take some very careful study. It raises the spectre of rendering the entire comsat useless if it were to malfunction.

But the idea of piggybacking on another satellite is not without merit. I don't think that the enormously commercially valuable GEO comsats are a likely candidate, but other satellites may be. For example, the Algore satellite won't be doing anything commercially valuable or scientifically interesting. It's just a showboat, and that might make it the perfect candidate to carry a worthwhile parasitic payload. That's something worth vigorously pursuing.

>seen any studies on the launcher requirements for this.

The path loss reduction is only about 3 to 6 db. That's not insignificant, but it isn't enough to overcome the added risk to the electronics. Unlike LEO, it would still require ground stations to use tracking antenna systems, so it represents no real cost savings there either.

And the Van Allen belts are an enormous concern. They wreak havoc with satellite electronics, particularly command and control computers. And they rapidly degrade solar arrays. That's why the dwell time of satellites in that region is minimized. And that's why launch opportunities to that orbital belt are virtually non-existent. Perhaps we could build an all vacuum tube

satellite with a solar thermal (steam) powerplant to tolerate the conditions, but I suspect that such a satellite wouldn't be very capable, or have a very long lifetime. (It does appeal to my Rube Goldberg imagination, however.)

>I think the thing to remember is that if the average ham is going to put
>out some of his hard earned treasury for a space project, it has to be
>usable by him personally, without building the VLA in his backyard.

That's true, but even Voyager, now outside the solar system, only requires a Goldstone size dish, not the VLA, to receive. :-)

Lunar Prospector is a useful benchmark in this regard. Its 5 watt signal can be received with no more than an ordinary 3m TVRO dish and a modified S-band downconverter. About 5 million Americans already have those dishes in their backyards. And thanks to DSS, many of them can now be had for the asking. So I would suggest that a Lunar Prospector class satellite could be considered within the operational reach of a large number of amateurs.

There is considerable interest in the Uosats, and some in Dove. That shows that not every amateur satellite has to be a comsat. If it is doing something interesting, it could develop a fair sized following. The most interesting thing to most people seems to be pictures. A lunar orbiting satellite broadcasting back closeup snapshots of the Moon would likely attract worldwide interest. (And interest in amateur radio in general.)

Since it could orbit the Moon very closely, even a mediocre imaging system would be spectacular. If we built such a satellite, and it needn't be that expensive if built in typical AMSAT fashion, we might be able to attract commercial or government sponsorship sufficient to at least cover launch costs to GTO thanks to the renewed interest in the Moon generated by Lunar Prospector's discovery of water there. That's 90%, and surely we can scrape up the other 10%.

Do we *really* want another AO-27? Sure, it is easy for Joe Everyham to access, but even Joe rapidly gets disgusted with it. A single channel FM repeater in space isn't that hot an idea operationally. IMHO, AO-27 is a technical success, but an operational failure.

>Another would be for an ATV repeater (not SSTV, although that might be >tried).

ATV would require some serious ERP, and some serious bandwidth. SSTV can be done now through the linear transponder birds. (Though a constant carrier mode is wasteful of transponder resources.) And digital SSTV can be done via the microsats.

Well, a KH12 is a *really* big satellite. :-)

Defraction limits demand a *large* primary optic to get high
resolution on the ground. And adaptive optics are needed to
deal with the pesky atmosphere's distortions. And target
tracking from LEO is another large challenge. A KH12 is
the size of a house trailer, and it couldn't be much smaller
and still do what it does.

>You know, I'm not so sure the smaller is really better. I wonder

>Maybe that's part of why I find it interesting.

Yeah, hitching a ride isn't easy no matter what. But it is marginally
easier if you can replace ballast on a lightly loaded commercial
launch. It'd probably be much easier if the satellite did something
interesting to more than the small amateur comsat user community.
If it did something that fired the *public* imagination, it might find
quite a bit of support.

I'm pushing the idea of a Lunar Brownie, a simple camera carrying
lunar orbiter. It is within our capabilities, and it would likely attract
worldwide interest. We could even arrange to relay some of its
pictures via our existing microsats so that even scanner equipped
members of the public could access them.

Unlike an Earth imager, the problems of getting fairly high quality
pictures of the lunar surface are less daunting. That's because the
Moon has no sensible atmosphere. That means we can orbit *very*
low, and we don't have to compensate for atmospheric distortions.
Even the Webersat camera would get some pretty great pictures in
a low lunar orbit (though we'd need to add motion compensation,
a mechanically scanned imager is likely a better choice).

>What about making a second P3D? Using exactly the same boards

That's not a bad idea. Getting a ride for it is the problem.

>-- that would be the contest.

Well there are the ZRO tests. Competing to see who can hear
the weakest signal does attract some people. And it prompts
them to improve their satellite stations so that they are less
likely to operate QRO in order to hear their own downlink.

But most contesting *is* type-A behavior. And that's generally
undesirable with a limited resource like an amateur satellite.

735. MOON Site for Repeater?

Newsgroup: rec.radio.amateur.space
Date: 1998-04-05 00:00:00 UTC
From: sco@sco-inc.com
Message-ID: <3527a148.1531890@news.mindspring.com>
Source record: 16561

Instead of orbiting the moon ... what about landing a repeater site on the moon? Could it be done? How large a technical effort?

Sine the repeater would no longer "be in space" but on another object (the moon) what callsign would/might it have ? What callsigns are available for use on the moon? Has the FCC made any plans for this?

Since only Americans have been to the moon and since we planted our flag there I assume the moon should be US property ???

There was an interesting discussion in this group on that very subject a
few months ago.

My impression of the outcome was that it was possible, but very difficult.
Orbiting the moon was somewhat easier.

Oddly enough, the most difficult part turns out to be the first hundred
miles; i.e., putting the payload into LEO.

I agree with most of your comments on the GEO situation, although I
still think there's possibilities, because of the goodwill, publicity,
and tax write-off it might provide to a commercial. The antennas and
EMI are definitely an engineering problem to be overcome.

For the MEO, the Van Allen belts are not all that wide. There are many
orbits in the 5000-1000 mi range where radiation is negligable. In
fact, a whole new worldwide commercial comsat system will soon be

launched there. A lot of things have been done to improve radiation hardening in satellites in the past two decades. Let's not forget that our Molynia birds pass through the belts twice on each orbit. That's why AO10 went brain dead in a short time (Radiation hardening too expensive at its time of construction) whereas AO13's computer memory was good right to the end. But you're right that there aren't lots of launches to this region.
I think that some non-comm sat ideas have merit, as long as their construction is subsidized by someone besides us hams and AMSAT in particular. The AMSAT Board feels, and I agree, that any sat that is built with purely ham money should benefit the maximum number of hams worldwide, and especially those that foot the bill. The moon camera sat sure sounds like a winner, but boy, the launcher?????????

Another thought I have had is to build an LEO with enough power to be used routinely by a handheld FM transceiver. AO27 paved the way on this one, although quite limited in what it does, proved the concept. Maybe 5-10 UHF voice channel pairs could be cleared worldwide to allow for this type of operation. Not sure what the other ITU regions have going in 440-450 MHz. I'm sure lots of folded-up solar panels would be needed for this one.

Let's keep thinking everyone....I've heard some good ideas here.

BTW Gary, the VLA is needed on Voyager for the high-speed data mode (pictures and such) :)

If we could get a good speed tcp/ip through the thing it might be
possible to start running stuff like RealVideo. I think the Internet
has created huge incentives for companies to squeeze content through
28Kbaud modems. I think it'd be a big win to be able to tap into
the stuff that already exists for modems. I believe the RealAudio/
RealVideo type of stuff can deal with lost blocks.

I figure downlink power shouldn't be a problem for wideband stuff,
provided we all get really huge dishes. Err, or maybe there's
some middle ground where the satellite isn't so big, and neither is the dish.

Hmm, can the DSP on P3d do 56Kbaud? Will P3d run digital and
analog at the same time?

You know, with P3D and 10Ghz downlink, I was wondering with
those DSS feeds -- aren't they around 10Ghz? Maybe these things
can mix down from 10Ghz ham band already. Hmm.

I am looking into creating an Satellite ground station capable of working AO10. If there is someone else in the Central Ohio Area that has already done this and does not mind showing me around the shack for some pointers, I would really appreciate it.

Please e-mail me...Thanks.

Life Magazine just published an interesting edition about the lunar
landing. Apparently there is a seismometer that was left behind on the
lunar surface. Solar powered with what appears to be an S band helical
antenna. Anyone know if it is still transmitting?

Since the Brits got to the states first the USA should be our property?
Don't think so. The moon belongs to the man in the moon is about as
logical.

The Brits LOST the colonies, remember? They could not adapt to
different battle styles of us Americans.

And we USA types could not adapt to the Vietcong (probably could now), but
what does this have to do with anything?

Recreational Radio Amateur Space.

Satellites, Moon repeaters, EME......

Just a thought.

Soviet robots have been there too.

No nation can claim the moon. The treaties are similar to those
that permit Antarctica to be a base for scientific research and such,
but which prohibit any nation from claiming the continent, or any
piece thereof.

The wording of the plaque on the Apollo 11 LM reflects this.

If I recall correctly it was shutdown quite some time ago after they ran
out of funding to monitor it. Darn shame.

Moreover, IIRC, a university offered to monitor it, but it was shutdown
anyway.

I hope they had a better reason for shutting down a valuable source of,
umm, lunarlogical? data than just losing funding. I'd hate to think they
shut it down just because they were in a snit over losing funding.

Actually, Antartica has been divied up in a very complicated manner.
Treaties may prevent countries from using the continent for anything but
research, but, strangely enough, the borders are drawn...

Hi,
Glad to hear you are interested in sat communications!

The local cable tv company has short lengths of 75 ohm hardline--their idea of short will equip the average ham station on all bands.... As a service school club, they will probably have no problem donating cable to you. Connectors can be a problem, but consider it training in appropriations....(;^) Matching this to 50 ohm loads and inputs can be considered an appropriate project for communication engineering students...

I've found duplexers unsatisfactory as even with 60 db or so of isolation, 50 watts of cw does leak through......

Towers can be had by scrounging techniques--approach your local communications companies and their suppliers

Have fun and I hope to work you on the air!

Wrong, what we could not adapt to was political leaders at home who
would not allow us (military) to win. Mine the harbors in North
vietnam for one. Sink any ship entering the harbor with war materials,
etc. declare war on any country aiding North Vietnam.

Why we (USA) gave it (the moon) away I will never understand. It could
have become the first US colony in outer space.

It was never the place of one country to "give it away". The legal
status of the Moon was established, by international agreement,
long before Messrs Armstrong and Aldrin (who came "in peace for
all mankind") got there.

Radio Meteor Observation Bulletin No. 56 April 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Barcelona, Spain (01 59' E, 41 21' N)
Frequency: 48.250 MHz
Transmitter location: most likely Czech television C2 C. Budejovica,
100 kW, horizontal polarisation.
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (100 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT and
"Data Capture" software with 9 second/18 sampling interval to
store all the > 1.0 s signal increases.

Note:
. data loss March 1-8 due to electricity fault
. maintenance of the station on March 14, 10h-16h

Enric Fraile Algeciras

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 deg (= E),
elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

Notes:
. ? probably affected by sporadic-E, direct reception.
. local time = UT + 1 hour until March 28,
local time = UT + 2 hours from March 29 onwards

. * warning for relative high number of long duration reflections.
We are trying out if a fairly simple criterion is able to detect stream
activity. Based on the observations of November 1997 (see RMOB9511), we
found that both for the Leonids and alpha Monocerotids the ratio

long duration reflections/all reflections

exceeded 0.2, and for all non-stream activity this ratio was lower.
The * in the table above of reflections longer than 1.0 s indicates
hourly values for which this ratio is also higher than 0.2.
This criterion has to be calibrated with more and more recent observations.
A confidence interval for this ratio will be developed as well.
Chris Steyaert & Maurice De Meyere

Maurice De Meyere / via Jeroen Van Wassenhove

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

Not as long as NASA is running the space program we won't.

Sorry, I'm feeling snarky this evening.

And I suppose the USSSR didn't have a chance at making it into space
before us either? We (yes WE) Americans need to stop and realize that
while we may be a super-power militarily, it counts for nothing as far
as the technological and business world are concerned. We are training
foreign engineers as fast as we can, only to send them back to their
homeland, and develop better technology. The whole "Made in the USA"
fad is going to die out once we don't make anything anymore...

What agreement? Correct me if I'm wrong, but the only space treaty "giving it away" that I recall, we refused to sign (in a temporary fit of sanity probably). And this was after the landings. If I'm wrong, I'd like to know the name of the treaty.

Arguably we _could_have_ claimed the moon, or some portion of it. Whether we _should_have_ is another matter, and whether anyone would abide by that claim is another. But we didn't. Nor, as far as I can see, did we relinquish any claim.

"We came in peace for all mankind."

But it's all rather academic since it seems nobody's going back for quite a while (if ever).

> status of the Moon was established, by international agreement

Yea, but we _signed_ that agreement. And we did it at a time when
only the US had an active program to get humans there. Before that
agreement, existing international law would have allowed the first
people there to claim it for their country.

At the time, a _lot_ of people argued that we should not sign it.

I am really new to amateur radio... in fact I just picked up my first handheld. I am in Central Illinois, and am wondering if I can access any space freqs/repeaters... or montior.

Thanks for the info.
Mike

They might have been able to get a man there, but getting back was the
tough part. Unless they did get back they could not register there
claim.

There was a distinct possibility that the Soviet Union might have get
there first :-). So it made sense for the US to sign the agreement.

For decades there has been rumors about a Soviet super booster code
name G-1 (or according to some sources N-1).

According to information released a few years ago, several big rockets
were built. The base diameter was even larger than the Saturn-V. The
plan was to use some vehicle derived from the Soyuz to get one man to
the Moon.

At least one rocket exploded on the pad causing large devastation in
the neighborhood. An other one got off the ground but exploded soon
after. Some low quality film has recently been released from this
launch.

The maiden flight of the Soyuz crashed in late 1967. This string of
failures finally terminated the Soviet manned lunar program.

In mid 60's it was not at all certain who would get to the moon
first, so in retrospect it made a lot of sense for all parts to sign
the agreement.

Yeah, and I could have had the first hot dog stand on the moon!
We could have served the best Lunar dogs in all the Mare Serenetis!
Of course, some people might find a lunar hot dog stand as lacking in
atmosphere....

My point exactly, why did we (the USA) ever agree to such an
agreement? It was not very likely that any country other than the USA
would get there first. Russia did not have much of a chance. Nor did
any other country.

It didn't matter who got there first. You had to get there, document it so the world would believe it (like live TV broadcast from the moon) and then get back to earth to register your claim. If you didn't get back alive it would not matter if you got there.

774. Winorbit Question ?

Newsgroup: rec.radio.amateur.space
Date: 1998-04-09 00:00:00 UTC
From: gilly@camtech.net.au
Message-ID: <352c4582.19721139@news.camtech.net.au>
Source record: 16500

I am using the excellent Winorbit program by KC8G to calculate
Mir passes

I have found it very accurate but for a small detail.

If I do a "Next Pass" (F9) report and then do a
a " Print Ephemeris" (Above Horz) Report
The times and location of the satellite vary
mainly in the area of elevation.

Can anyone help or am I expecting an unobtainable degree of accuracy ?

I would have thought that both reports generated
(ie "Next Pass" and " Print Ephemeris" would have identical
results.

There is probably a simple solution
Quite possibly my error !!!

Can some please set me straight.

Regards

Direct Email welcome

What makes you think that this was planned as a one way trip ?

An other interesting question, where should that claim be registered ?
In the UN ? In the Vatican (compare the dispute between Portugal and
Spain in the 16th century) ?

Did all those Europeans that occupied some land area within current US
borders before 1776 return to Europe to register their claim ? Or is
it more PC to ask, at what Indian tribe did they register their claim.

In real world there is not much idea in registering claims if you
can't defend your claims either by yourself of some superior authority
(which would be hard to figure out in the case of the Moon).

776. Announcement: Java Satellite Ground Station Software Released

Newsgroup: rec.radio.amateur.space

```
Java Satellite Ground Station Software
--------------------------------------

I have put a preliminay release of my Java Satellite Ground Station Software
on my website http://www.qsl.net/n6lyt.

This software implements a fully automated Digital Store and Forward Satellite
Ground Station.

It includes:

KISS Protocols
AX25 Protocols
Pacsat Broadcast and File Transfer Protocols
Message Composer
Message Viewer
Orbit Propogation
Satellite Scheduling
Radio Control
Rotor Control

The software has been successfully run on Windows/95, Linux and Solaris.

There is still more work to be done, but I have been successfully using the
software over the last few months with minimal problems.

The documentation is not complete yet, but there should be enough to get
going.

Further documentation for developers is under construction.

I would be interested in receiving an email message to n6lyt@qsl.net from
anyone who decides to download and try this software.

Also, if you are interested in helping with this development, let me know by
sending email to n6lyt@qsl.net.

How about a single transponder 1.2 up 2,4 down, orbit as high as possible. Keep the RF/digital stuff simple -- make the thing all fuel and batteries.

Btw, is it going to be possible to use a single dish for transmit and receive at the same time? I assume not. And, that in the microwave world of the future we'll see 'Mickey Mouse Ears'-looking antenna setups -- that could be cute.

782. Wastage of Electrons (Was: MOON Site for Repeater?)

Newsgroup: rec.radio.amateur.space
Date: 1998-04-09 00:00:00 UTC
From: Kevin@Computer.com
Message-ID: <6gjcdd$8b0$1@samba.rahul.net>
Source record: 16508

Any first settlements on the Moon, Mars, Asteroid belt etc will surely be done with an international effort; and so the site will not below to any country. It will have some special status; being shared by all countries.

The only way you can have someone 'own' something up there, is if you had enough people there to have a self-sustaining culture - and identity. That is so far off, if at all, that we do not have to worry about.

Now, if you found a large cache of gold or something - there are two choices: either people start staking out claims, in which case there are only a few countries that would really benefit (like the usa) or you agree to mine it, and use the proceeds for some good cause - like furthering space exploration.

I think overall it is a waste of electrons to have this debate, because there is so little infrastructure up there that the debate is meaningless. If this debate continues, I am going to report it to Internet Central; and they will be in contact with all parties that wasted internet bandwidth with useless messages - and will require that you pay back the electrons.

Now, seriously even - didn't this thread start with a question about putting a repeater on the moon? I think space has so many possibilities, why not explore all the cool things that can be done in space to further our hobbies, to learn more, to help school kids, and so forth - what can be done with us normal people using space devices - repeaters, cameras, satellite stuff, etc? Lets talk about *that* stuff!

Kevin

To all radio amateurs

SB SPACE ARL ARLS007
ARLS007 Mir-school QSOs

US astronaut Andy Thomas, KD5CHF/VK5MIR, thinks we may not be alone. Speaking via Amateur Radio April 8 with high school students in Roswell, New Mexico--the self-proclaimed UFO capital of the world--Thomas said in response to a student's question that he believes there is extraterrestrial intelligent life. ''Yes, I think there probably is, when you consider the scale of the universe,'' he said during a scheduled Mir-school contact with students at Goddard High School and Roswell High School.

Thomas described life is ''a very tenacious thing,'' that could exist beyond the bounds of Earth. But he said he very much doubts that space beings ever visited Roswell, as some assert happened in the late 1940s. Tourist attractions in Roswell have since capitalized on the UFO talk.

The New Mexico high schoolers asked 11 questions during the approximately 10-minute chat with Thomas, which took place via a telebridge with VK5AGR in Thomas' native Australia. Some 120 people, including fellow students, parents, teachers and the news media, were on hand for the occasion.

On April 9, Thomas told students at Land of Pines School in Howell, New Jersey, that the money spent on space research represents a long-term investment and ''one that we have to continue to make.'' Thomas said he trained for a year for his Mir mission. Students got to answer ten questions during a contact that was interrupted halfway through by communication troubles. During the contact, student teams tracked the space station as it passed overhead and announced its position relative to Earth.

Mir-school contacts resumed earlier this year after a one-year hiatus. They are being arranged through the SAREX program, a joint

effort of NASA, the ARRL, and AMSAT, in cooperation with the Russian space program. Other contacts are set for this month with schools in New Jersey, Connecticut, and Massachusetts.

Message-ID: <01bd6423$e2f6cce0$7e60b6cd@cbx-nt>
Source record: 16511

Would not a 10 meter J-Pole or vertical dipole provide better coverage for working the RS birds? Has anyone tried this? I have a scheduled connection to be made from two portable locations. The fellow HAM does not want to try AO27 siting congestion. It would appear the RS's and FO's are our best bet.

Input is appreciated!

MIREX School Day Test 27 April 1998
Dr. Larsen N6CO - Presdent MIREX
doc@volcano.net

MISSION: To permit maximum participation by schools and students
in a joint MIR communicatons experiment, the MIREX team has authorized
a special MIREX School Day test on April 27th 1998 between 1000 to
2300 UTC.. The purpose of the test is to improve the understanding of
students about the Space Station and demonstrate the factors involved
in space communications using amateur radio. Of the many schools to
participate, even schools for the deaf and disabled will be able to
experience the event through their computer displays.

PARTICIPATION: There is no limit to the number of stations that can
participate, since any amateur radio station at any school in the
world may monitor the downlink of the test. All stations will be
able to capture and log communications from both MIR itself and the
other schools authorized to transmit. Due to the limited capacity
on the uplink, however, the number of stations authorized to transmit
will be limited to under 100 per footprint area. In general, only
schools and other youth group demonstrations will be authorized to
transmit. For planning purposes, schools intending to transmit should
send Email to wb4apr@amsat.org including the following brief
information:

1 Callsign and Point of contact
2 School Name or affiliation
3 Number of students that might participate
4 Equipment used at the School (power and antenna type)

After the test, we would like to hear about any media coverage or any
interesting observations or special events at your site.

OBJECTIVES: To allow the maximum probability of success on each orbit, schools will transmit via UI frames and the experiment will proceed in phases. As each phase is successfully accomplished, then additional complexity may be added to the experiment. This phased approach makes sure that everyone gets an equal chance of success without congestion while allowing for additional capacity if it exists.

BULLETIN PHASE: Receive the special MIREX bulletin. The MIR packet system will downlink a brief BULLETIN once every 3 minutes. Each school should expect to capture these bulletins on their Bulletin display at some time during the pass.

POSITION PHASE: Concurent with the Bulletin Phase, the next objective is for each transmitting school to successfully relay a position/status report via MIR and for all other schools to receive them. A position packet will look something like this:

W3ADO>GGggGG,R0MIR*:]k[US Naval Academy. 75 Students 35w. Hi MIR!

Here, the GGggGG is the stations grid square which is sufficient to locate
the school to within about 3 miles. The]k[is the map ICON for a school.
Stations may transmit these single packets at about a one-a-minute rate until successful. Once they see their position in the downlink, then they should stop sending their position.

MESSAGE PHASE: After each school has captured one full page of position packets (16 stations) from other schools, indicating others are being successful and their station is hearing the downlink, then the authorized schools may send a single message packet to any other station.
For each additional page of 16 positions that each school captures, it may
send additional packets up to a maximum of 5.

MONITORING SOFTWARE: A special version of packet software called MIRMON has been donated for unlimited use during this experiment. MIRMON will capture all position reports, bulletins and messages and give schools a consistent display of the event. The software may be downloaded and further test details as well as a replay of the last such experiment are available on the Naval Academy MIREX WEB page:

http://web.usna.navy.mil/~bruninga/mirex.html

Schools with at least a 2m FM 25 watt radio and omni antenna and conventional TNC should be successful. Individual HAMS desiring to participate are welcome to monitor the test in RECEIVE ONLY, or to visit a
school and set up a demonstration to qualify to transmit... This means all stations should be manned and not operated unattended.

Even schools without current ham radio equipment can monitor the event via

the live WEB pages above and also at www.mirex.net. We are trying to find dedicated ground stations, at least one per continent, that can link their receiver to our growing network. Currenlty we have feeds in the Eastern USA, Mexico, and Spain under construction. To see the combined feed from these staitons, BROWSE the web site above or TELNET to
www.mirex.net.

For school info contact Bob at wb4apr@amsat.org

73!

Yes, P3D is capable of operating 56 kb, and yes it has the power to
operate more than one band and more than one mode at the same
time.

>You know, with P3D and 10Ghz downlink, I was wondering with

They're at 12 GHz. Shouldn't be that hard to shift them. But P3D's
output power on 10 GHz is very modest compared to a DSS sat,
so you'd need a bigger dish.

Oooh, this isn't so obvious to me. Like DSS has the 'really big
satellite' power gain. But then the DSS system sends down, like
100 TV channels whereas P3D is only 250Khz of ham radio. And, the DSS
satellite is at a geosyncronous orbit, which is higher than P3D,
right? Hmm, are there real numbers out there for the power on the
DSS system. Maybe it'd be enough just to know what the gain of
the DSS dish is.

Hmm, I get about 33db for a 1ft radius dish at 10Ghz -- does that sound
about right. Assuming that the P3d's power at 10Ghz is remotely in the ballpark
of what it is at 2Ghz or 440, this otta' work, I'm now thinking.

Gawd, why even mess with frequencies lower than 5Ghz. Small antenna =
minimum ham radio hassle, imho.

This is what's so frustrating about this P3d thing is that it's so
blasted tantalizing. There's really the potential here to re-invent
the hobby.

The european units start at 10.7 and usually work very well in the
high end of the 10 GHz ham band. Everyone uses them here for ATV.

>They're at 12 GHz. Shouldn't be that hard to shift them. But P3D's

The bandwidth is very much less, which improves the situation.

Of course you can't use a TV-type converter for SSB because the
local oscillator is a DRO and not stable enough. For wideband FM
it is OK, so you can probably use them for some fast FSK.

Rob

I use the HDL_ANT program by N1BWT to calculate dish feed locations and
many other factors. It does regular and offset feeds. Available at:

796. 6 meter FM Simplex DX

Newsgroup: rec.radio.amateur.space
Date: 1998-04-12 00:00:00 UTC
From: kf4tuz@hotmail.COM
Message-ID: <19980412151009.14634.qmail@hotmail.com>
Source record: 16522

I was wondering how good 6 meter FM simplex is compared to 2 meter FM... I heard that it "blisters" 2 meter FM, and I have also heard that you can barely hit 6 Meter FM repeaters ... I sort of beg to differ on the latter.. I know that the band by what I have read is sort of closed down right now with the ssb side of it, but I'm getting a 6 meter FM transceiver soon and was wanting to know for sure. Also.. I read in a short statement that the sun cycle was fixing to allow for the 6 meter band to open back up... does this help the FM side of it also any at all??

Thanx,
KF4TUZ, NC, USA

Yes!

As an apartment dweller, I'm looking forward to this too.

One of the props I use in my satellite talks is a home-made
10 turn 2.4 GHz helix. It's about the size of my forearm,
and jaws sag when I tell them that it may actually be a
bit big for P3D.

The big challenge appears to be clearing the mental block
so many hams have for opoeration about 450 MHz.

>the DSS dish is.

DSS sats run 500 watts honest RF output. That's divided among all the
channels of course, but they aren't really using all the channels now. And
they do have big gain antennas on the sats which boost the ERP to very
high levels in a number of spot beams aimed at population centers.

OTOH, P3D's 10 GHz source is milliwatts, and the antenna used is
whole Earth, so its ERP isn't that much. At apogee, P3D will be *higher*
than geosync too. Bandwidth is much less, and that helps, but I doubt
a DSS home dish will suffice. You'll probably want something at least
twice as big.

Gary, do you have a source for that "milliwatts" figure?

AMSAT-NA's web page says 15 watts, into a respectable horn.
AMSAT-DL's web page suggests a 60cm dish for the 10 GHz
downlink...

Well, I live in a house, and I'm working on getting an HF
beam up -- and it is lots of stress and money to do this
properly. Little dishes on the roof -- no big. I also imagine
all those Japanese hams in little apartments working the
world with small dishes. I don't think there's gonna' be
a problem getting people on 10Ghz when and if the thing
launches good.

I think the equation is:

niftyness = (# hours of good dx per year)/(size of antenna and support)

Use a capacitor to block the voltage to the scanner as you do for your
masthead pre amp.
3pf 50v high quality ceramic capacitor
scanner----------||----------dish
|
>
< Resistor to limit current
>
|
+volts (usually about 20v)

Capacitor is dependant on frequency but about 3pf should suffice, the
negative volts feed to ground coax out. Put the lot inside a die cast
box with connectors for coax in and out and power connectors. Do not
coonect the wrong way round or bye bye scanner.

Hi all,
Does anybody know the satellites other than MIR and the Moon that are visible with the naked eye from the south of UK?. I have seen Mir almost every night but I do also see quite a few other things floating across the sky which are quite obviously not aircraft but none of the sats that I track are over me when I see them. any ideas ?.
Thanks in advance
Ian.

804. Monitoring MIR Packet

Newsgroup: rec.radio.amateur.space
Date: 1998-04-13 00:00:00 UTC
From: JoeWalker@webtv.net
Message-ID: <6gtuh7$9qm$1@newsd-102.iap.bryant.webtv.net>
Source record: 16436

I'm faiirly new at packet and especially packet aboard the MIR. I have checked out various Web Sites but have not found the answer to two questions:

(1) When monitoring MIR during a pass, on 145.985 simplex, I see dozens of stations that appeared to have connected to MIR but understand that only ONE station at a time can connect to the MIR. My question is this: are the various callsigns I'm seeing while on the monirot function connected to MIR? If not, I'm not sure how I could copy them what with the distance some of the callsigns appear to be from me.

(2) I realize the "rules of conduct" while working MIR is to waiti until the station currently working the space station has ceased before you try to send a connect message...BUT...from the looks of my screen and the sounds of the packets, this looks like one big pile up reminding me of some rare DX station. I've yet to see a CQ called from the MIR only a multitude of calls during the pass. My question is are folks really adhereing to the "rules of conduct" or is it more "every ham for themselves"?

(3) My goal in working MIR is simple: I would like a QSL card verifying I was successful. I know the steps of getting the card AFTER I work the MIR but my question pertains to the manner in which the all important message number is aquired which I use to verify I worked the station. Do I send a message to the crew which would generate a message number? I know those guys are really busy and I can't really think of something all that important to send to them....BUT....I would like the QSL card (nothing wrong with honesty, is there?) Is there a way to have the number generated WITHOUT leaving a message for the crew?

There seems to be some confusion about terminology here. There is one unit known as the "transmitter" producing a 200 mW signal. But there are also two separate power amplifier feeding separate horn antennas. The solid state power amplifier produces more than 10 W in saturation and the TWTA more than 60 W in saturation. Of course, some back off is required for linear operation. Take a look at

http://personal.eunet.fi/pp/oh2aue/

>At apogee, P3D will be *higher* than geosync too.

The apogeum of a typical Molnya orbit is slightly more than the geosynch orbit, but the effect on path loss is only 1-2 dB.

It is not clear which modes will be on at which phase of the orbit, but hopefully it will be close to the apogeum, since otherwise, the doppler would be quite severe :-)

Only ONE station can be connected to R0MIR-1 at a time. As well as the R0MIR keyboard. Your probably seeing some folks use R0MIR as a digipeater.

>(2) I realize the "rules of conduct" while working MIR is to waiti until

Pile-ups is the right word. There is a LOT of folks on the ground who want to make contact. There are also "mir hogs" who think they have to try connecting on EVERY PASS. This is unfortunate for the rest of us.

>(3) My goal in working MIR is simple: I would like a QSL card verifying

If you are LUCKY enough to get into the PMS send the crew a SHORT hello/good luck and save message. If possible try to prepare this in advance, some packet programs let you compose "offline" then after you SP R0MIR you can Upload this pre-made message faster than you could type it. Do your control Z and you'll get a message number. Logout.

No. Just send a short hello/good luck, that's all you need. They'll
appreciate it it just the same.

Good luck!

>adhereing to the "rules of conduct" or is it more "every ham for
>themselves"?
>

The problem I have is to many big stations here on the East coast,
look for the "D" following a staion - staion is disconnecting and
start trying to connect.

>(3) My goal in working MIR is simple: I would like a QSL card verifying
>I was successful. I know the steps of getting the card AFTER I work the
>MIR but my question pertains to the manner in which the all important
>message number is aquired which I use to verify I worked the station. Do
>I send a message to the crew which would generate a message number? I
>know those guys are really busy and I can't really think of something
>all that important to send to them....BUT....I would like the QSL card
>(nothing wrong with honesty, is there?) Is there a way to have the
>number generated WITHOUT leaving a message for the crew?

I think you have to generate a message and save it into the system
inorder to have a valid message number. When connected just send (S)
message to R0mir-1 and make a quick message - time is short. I hope
this may be some help.

Why, that would mean that the longest DX would be on the X-band
downlink -- heaven forbid. Me, I'd be happy for a
good ham radio link to Europe from the west coast here. I still
haven't figured out how to work Europe from California
on HF. (Though Japan/Pacific/South America -- and Texas, I
get pretty regularly.)

818. Will We Lose 1.2g ?

Newsgroup: rec.radio.amateur.space
Date: 1998-04-14 00:00:00 UTC
From: sco@sco-inc.com
Message-ID: <3533d876.4564783@news.mindspring.com>
Source record: 16444

1.2 GHZ THREAT

The ARRL has learned that the second civilian frequency for the global

positioning system (GPS) could wind up within Amateur Radio's secondary allocation at 1.2 GHz. A decision on whether the new, second frequency will be 1205 or 1250 MHz is expected to be made in August. An allocation at 1250 MHz could mean the end of Amateur Radio in the band 1240 to 1260 MHz. The Amateur Radio 23-cm band runs from 1240 to 1300 MHz.

In February 1997, the Department of Transportation (DOT) and the Department of Defense (DOD) announced an agreement assuring civilian GPS users of a second frequency--referred to as L5 and considered essential for critical civilian GPS uses. According to a DOD news release, the White House Commission on Aviation Safety and Security, chaired by Vice President Al Gore, "called for the establishment of a second civil frequency as part of a broader program to maintain US leadership in aviation and satellite technology."

For more information, see http://www.defenselink.mil/news/Feb1997/b022797_bt095-97.html.

Such a new freq at 1250 would KILL our 1.2g link to P3D.

Maybe we should start writing Congress and the White House to stop any such use on 1250 mhz. I guess 1205 mhz would not hurt us???

Hi,

I just aquired a pair or MRF157's and would like to construct a 1KW amplifier. Does anyone out there use such an amplifier. I am very interested in exchanging information with other users of this transistors. I have read the QST,September 1992 as well as the RF Design articles. Please email me directly so we can chat. Thanks for all the help.

May I suggest a DXpedition to Kwajalein Island.
When you see a missile approaching, you reverse engineer the trajectory and see if it departed from Vandenberg AFB. If so, your program is working correctly.
If it departed from Bagdad, it probably won't hit anywhere close, so don't worry. Don't worry, that is, until the Chinese transfer American missile technology to Saddam.

Hi all,
recently a nice chap here told me how to connect a dish to a scanner
and keeping the DC out of the feed, what I am now asking is, is it
possible (i suppose) to directly connect a meteosat dish into an AR5000
scanner (i am buying one), thus saving me the cost of a d/converter as the
ar5000 goes up to 2.6ghz and it has selectable bandwidth on it.
Thanks for any info (especially if you have tried similar).
Ian.

826. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-04-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6h1ujb$huq@news.Hawaii.Edu>
Source record: 16452
Cross-posted to: rec.radio.amateur.space,rec.answers,news.answers

Archive-name: radio/personal-intro
Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

No... because the satellite uses a circularly polarized downlink signal, and
is above the radiation plane of a vertical antenna (except near the
horizon...), your best bets are crossed dipoles (turnstile), full-wave loop, or
horizontal beam pointed at the bird.
The turnstile and full-wave loop help minimize the effects of
cross-polarization.

I get pretty decent results with a dipole in my attic, but was blown away by
the results with a full-wave loop at Field Day last year! As soon as I can get
up there, I am replacing the dipole with a loop.....

How is this loop constructed?? Do you feed each end of the loop using coax
and braid, or do you use a balun??

I'm in a situation where I have to be a 'stealth' ham, so all my antennae
are in the attic. I've heard other say that a horizontal loop is quite
effectove, but am unclear on how one is constructed, tuned, and fed.
Please elucidate...

830. Problem with P3D Freqs.

Newsgroup: rec.radio.amateur.space
Date: 1998-04-15 00:00:00 UTC
From: sco@sco-inc.com
Message-ID: <3535092d.339955@news.mindspring.com>
Source record: 16456

I think I may have found a problem with P3D that hopefully we
will be able to fix before it launches.

The freq ranges below are listed on the AMSAT webpage as the
final freqs for Voice in the 1.2g band.

1269.250 - 1269.500
1268.325 - 1268.575

A friend's nephew is 9 years old and we have been telling him
that if he gets his Novice ham license he will be able to talk to us
on the new satellite (P3D). I knew that Novices could operate phone
on the 1.2g band.

What I did NOT know until today is that NOVICE voice freqs are
not the full band, just 1270-1295 mhz. According to my calculations
P3D will be about 500 khz OUTSIDE the NOVICE phone band.

The AMSAT QSL card with the P3D logo on it says " Phase 3D The
Satellite for ALL Amateurs".

So unless NOVICES can operate in the 2.4g or 5g bands we have
a PROBLEM. How do we fix this before P3D launches so that ALL
Amateurs will be able to use the satellite. Or is it AMSAT's
intention to discriminate against our NOVICE class amateurs? If so
they should change their P3D logos and literature to read " Phase 3D
The Satellite for ALL Amateurs (except Novices)."

If we can NOT change the satellite freqs then I suggest that
AMSAT should petition the FCC to seek an exemption to the rules so
that Novice Class Amateurs WILL be able to use P3D.

NO, It's not a problem.

By the time P3D gets launched, your nephew will be an extra class Ham with a place of his own, and the rest of us will be in a nursing home with our social security making payments on the launch bill.

Phase 3d reaction committee.

Ok fellows thanks for the tip..
I did find it at Hamtronics.com...
I would have to see it to believe that there converter
is that great but the price is right..
I found something better.. Downeast microwave
makes a real transverter but you can just buy
a converter for $200..435mhz to 28mhz...
There are reasons I'm saying all this but
Thanks for the replys...

>Laura Halliday VE7LDH/7 "Laisse le vent tout emporter..."

I was just putting up a frequency chart to show my friend's 9 year old nephew what a Novice class ham here in the USA could do. I had also just received a QSL card from KG2IC that had a color patch of P3D on it along with the slogan "Phase 3D The Satellite For ALL Amateurs." I then looked up the AMSAT article on the freqs to be used and discovered this problem. I bet it was an accident and NOT planned to leave US Novice class hams OFF P3D by putting it just 500 khz below there authorization.

I agree it must be changed with the FCC here. But I can not do that by myself ... but AMSAT has some pull here and if they ask the ARRL to also go with them to the FCC I bet the problem can be fixed. Expand the Novice authorization to add 1268-1270 mhz as a satellite subband for the US Novice hams. Otherwise it is clear that AMSAT must stop referring to P3D as "The Satellite for ALL Amateurs."

I wouldn't want to encourage you to do anything reckless or illegal, but
have you considered looking at the high-powered "model" rocketry web
pages? They may have some trajectory stuff.
Also, the JPL may have a "test" case that you could play with. Try em,
but lose the "mercenary" title.

838. Help Please! - locating Meteor/asteroid article(s)

Newsgroup: rec.radio.amateur.space
Date: 1998-04-16 00:00:00 UTC
From: Dick Harper <dharper@sprintmail.com>
Message-ID: <3536EEE9.18D9@sprintmail.com>
Source record: 16289

Hello,

I'm trying to find the publication (I believe it was within the past 12 months) where I read about the possibility a communications (HBO TV)satellite was possible killed by a meteorite. The article mentioned it was observed spinning with an observatory telescope. It mentioned how programs were moved to another satellite until another one could be brought into the damaged one's station (possibly G5).

The article also mentioned how within the not too distant future the Earth will be passing through an asteroid belt that could damage many commercial satellites.

The same or another article was accompanied by a drawing of an early American setting with meteorites looking like fireworks in the sky.

Any references appreciated.

Thanks for reading,
de N0USP,
Dick Harper - dharper@sprintmail.com

If this is true and we can not change the freqs on P3D then I think we
should seek FCC change to the Novice band on 1.2g such that we add
1268-1270 for Novice satellite sub-band phone with 10w power?

What, if anything, have you contributed to P3D Mr. Mouth. Before you
ask I am in the integration lab every time I'm in Florida.

842. List of amatuer sats ?

Newsgroup: rec.radio.amateur.space
Date: 1998-04-16 00:00:00 UTC
From: ian.koenig@ensign-net.com
Message-ID: <892691647@ensign-net.com>
Source record: 16461

Hi all,
I am currently mailing through a BBS gateway thanks to my sysop because I am temp. off the net. I was wondering if anyone could possibly mail me a list of current active amatuer satellites that I can pick up using a AR8000 hand scanner and external ariel from the UK, I know that this info is avaliable on the net but cannot get to it at the mo :-~(.
I would really apreciate it if you could put it in the body of the mail and not an attatchment and could you see if the list includes freq's for the sats, I have easily done MIR packet/wx sats/and picked up some signals in the 2m band which i do not recognise because of a lack of current sat list.
MEGA HUGE thanks in advance to anyone who could help with this.

Ian.

Source record: 16462

Hi all again,
I was wondering after watching "space night" this morning on astra, why don't somebody have a colour camera on MIR or one of the amatuer sats constantly sending 24bit SSTV pictures as it orbits, would that not be a lot more wonderful to look at than the grey weather images we see (not that i mind watching them though), it seems that it would be an interesting experiment as the average pic only takes a couple of mins therefore getting more individual pics on the average 15-20 min pass, it would be very cheap to do and although the res probably is not as good as wx sats it would be lovely to see the world in it's colourful glory on the cheap :-)?.

Thoughts on this anybody?.
Ian.

PS. it would seem that space night is also going out on a new channel on 11.685 ghz vertical (on astra)after 12pm gmt,it's called bayern "alpha" dunno if this is a "new" channel also doing it or that where space night is moving to, i have not been watching for a while. The were also saying (in german) something about live spacelab something or other on this alpha channel on 16/4/98 in the evening?.

Hi all,

I would appreciate any reply mails from anybody who has
any knowledge of MIR video downlink feeds, I currently have information
stating 436mhz fm is the d/link video freq(see below), is this still correct?. and
has anybody out here tried capturing it and if so did you succeed and how !.
also any information you may have on mir transmissions would be very much
appreciated, i currently am getting lovely trans from MIR packet on 145.9850
and good voice on 143.6250 I did pick up something on 143.6180 nfm after
hearing that this was the EVA freq, although I do belive that this may have
been the 143.6250 mir-ground frq offset due to doppler shift.According to the table
below the EVA-MIR freq is 121.7500 but I cannot get anything on that!.

This is what i have so far.....

OK who has captured trans from any of the above and what was your setup ?.
I already have the 143.6250 voice and 145.9850 packet data I am very interested
in anyyone who has ever seen or knows how to see video feed !!!.

Fantastically massive amounts of gratitude to those who help !!!.

Ian.

The internationally (in ITU) allocated amateur radio satellite uplink
band is 1260 - 1270 MHz (no downlinks).

> What I did NOT know until today is that NOVICE voice freqs are
>not the full band, just 1270-1295 mhz. According to my calculations

So it is purely an internal US problem and you want the rest of the
world to adjust their regulations (not just amateur radio regulations
but telecom regulations in general) so that your relatives could
operate.

I suggest that you try to change the US regulations instead.

And if you could get that change, the next thing you would complain
about is that the Novice class in the US is limited to 5 Wpep output
(requiring quite a lot antenna gain) and you would request a higher
power limit.

IMHO, instead of changing the whole world, you should use your extra
energy to teach your relatives some more things about amateur radio
so that he could pass the Technician test (and in fact get the Tech+
license if he already has taken the CW test for Novice).

Sigh. One more silly example of the American, ham radio 'Apartheid' system
with all the license groups in their little sub-bands. I really
don't know why novices don't get all of 1.2G. What would that hurt?
Does the rest of the world do it the same way?

Doesn't RS-12 have the same problem with the 15M uplink?

Since this is an amateur radio space newsgroup..
Does anyone know where you can get or buy 70cm
converters instead of paying hundreds of dollars
for all mode amateur radio equipment...
There are more 70cm downlink satellites up there
to listen to than 2 meters..
I would think there would be more ham getting to
this mode of operation if there was cheaper equipment
to be had..
Don't tell me about the scanners and handhelds because
you have to receive from 435 to 437 mhz usb and cw and fm..

I for one am sick and tired of these little Anti USA quips.....

I dont know, maybe novices should study...figure out what a helix is....
The Tech exam is pretty simple.

So then it appears that P3D as configured now intends to leave US
Novice class hams locked out of the system. The you are right we
need to change the US regs to allow US Novices to work P3D.
I would suggest adding 1268-1270 to the US Novice authorization, at 10
watts (so they can work P3D)?

The point here is that AMSAT advertises P3D as "The Satellite for ALL Amateurs". We (AMSAT members) need to do something ... either change the AMSAT advertising on P3D or request that AMSAT seek FCC permission to extend the current Novice class authorization to 1268-1270 so Novices will be able to work P3D, with 10 w power.

RS-12 does not/will not have the capability that P3D will have. Harder to work RS-12 anyway. But to place P3D just 500 khz outside the US novice class authorization is like thumbing our noise at them!! "Hey look at the big boys playing worldwide satellite over here but you can NOT join us."

Please excuse the novice question from an Extra class ham but I work RS-12 all the time and find it very easy to access (50w into a dipole for uplink, a long wire for downlink). Is it really true that the P3D bird will be even easier? I hadn't realized that P3D is intended to be an "easy sat".

>Please elucidate...
>
>

A 10-meter full-wave loop is a continuous conductor in the form of a square, 1/4 wavelength on each side (approximately 8 feet). It is fed at the corner where the ends come together with an electrical quarter-wavelength of 75-ohm coax as a matching stub. The one I used at Field Day was constructed of 1/2 inch copper water pipe with soldered elbows at three corners, and a PVC elbow at the feed corner to provide mechanical rigidity while insulating the ends of the loop from one another. That's how I plan to construct mine.

I'll try to draw one with Paint and send it as a bitmap file..... hopefully you will get the basic idea from either the description above or my caveman artwork.

Look in the back of any ham magazine for ads from Hamtronics, outside Rochester NY.... they make all kinds of convertors in kit and finished form.

Try Hamtronics; they have a set of converters you can use up and down.
I don't have a URL or address handy at work, but they advertise in the
ham magazines. I run transverters made from their modules on 222 and
432. Not too bad to assemble, but does assume some experience.

Thanks for the info... and I'll be looking forward to the additional
artwork. I have a spacious attic, and local zoning plus an XYL keep me from
an external antenna farm.

I'm hoping to build one of these for use in working sattelite downlinks,
since that is about the extent of my lowband activities these days. Also,
could you tell me about how much tuning range you have, with respect to
minimal SWR??

The frequencies for Phase 3D were set (and publicized) a long
time ago. Where was everybody then?

The fact that the U.S. Novice 23cm frequency allocations do
not coincide with nearby amateur satellite service allocations
(which P3D must honour) is an internal U.S. matter. You'll
need to sort it out with the FCC. Not with AMSAT.

Please consult published material (particularly AMSAT-DL's
nifty table of expected up- and downlink equipment requirements),
and various papers (AMSAT Journal, AMSAT Symposium Proceedings,
QST, RadCom, etc. etc. etc.) on just what you need.

While he was talking about AO-13's Mode S, G3RUH's articles
about Mode S (available from AMSAT-NA's web site) are useful
background.

Summary: yes, P3D should be the easiest yet. We just have
to be patient.

I just ran that through NEC4WIN95, verses a turnstile, 8 ft up, with its ends pointed down at a 45 degree angle, inverted V style, and the turnstile has MUCH better gain with a more evenly distributed pattern.

I would like to thank everyone, particularly John KD2JF, for all the guidance.

It should be the easiest bird to work if it ever gets up there.
Will not really need to track it. Same spot in the sky every two days
and there for hours at a time. No more this 5 minute window hunt.
Small antennas on the microwave bands. Low power. Multiple channels.
Multiple bands.

Pieter, I suggest you build an off-line supply. You can get circuits to do that from many places, notably from those who make the transistors and those who make the drive circuits. Not too complex, either.

You realize this is almost 2kW PER SUPPLY? You will need a 220VAC line at
minimum
Somehow I don't think this goes well with the next part, "to power a pair of
MRF154 small signal transistors".

Sanity check fail. Reboot universe.

Oh boy! What's up here??

First let me state: I'm not into satellites and have no deal with AMSAT at all, but I'm very interested in all that fascinating AMSAT efforts.
As far as I understand we (all HAMs!) have to be extremely grateful for all the efforts and favours that AMSAT and Arianespace are putting into the satellite and especially the P3D project(s). As mentioned before, Arianespace is the one and only space agency that provides almost free rides for amateur satellites and and I don't really understand what all that ranting is about. They had problems with their first launch ever and discovered potentially dangereous (for payloads) vibration effects during their fault analysis. I find it very nice from them to tell AMSAT about this and to have them modified the satellite in order to survive a launch securely.

If your highly regarded, all american proudness - aka NASA - ever offers similar space rides to the HAM community, then you're in the position to rant about Arianespace. If you personally contributed a good deal of money, time or material to the P3D project, then you're in the position to rant about what's going on with AMSAT and P3D. If nothing of the above applies, then you should remain quiet and give all the AMSAT, P3D and Arianespace people the high respect they deserve for what they do for the whole community.

What you described is a telecommunications power supply. Look for a used telecom vendor in your area for old Northern Telecom, Rolm, or NEC equipment.

2.4 GHz is better than 10 GHz given the requirement that the
antenna cover the entire earth. The coverage requirement limits
the antenna gain, unless you allow complications like spot beams.

Hi Stefan!!!!!!

Sorry California was such a 'wash out' when you visited.

On one hand I really do not like anti-American sentiment, much like you would not enjoy Germany bashing. On the other hand I am embarrassed by an administration who wants to rip away our 1.2 Ghz band, spend a billion dollars to put a camera in space so Mr. Vice President can mearly admire mother earth, yet cannot spare a decommissioned Titan to loft this bird.

I guess you are detecting a little frustration with the situation.

Hope to see you at an HPR launch!

Regards

Phase 3D must obey the allocations of the Amateur Satellite Service,
and the allocation is 1260 to 1270 MHz. Worldwide. Period. National
licensing considerations simply don't enter into it.

Let's not lose perspective - just how many hams are affected? Even
the ARRL publicize Tech/TechPlus as the preferred entry point into
ham radio. Non-issue. Few other countries chop the bands up the way
the U.S. does. Again, non-issue.

Which would you rather have:

"P3D, the satellite for all hams",

or

"P3D, the license for all hams except those with certain
classes of restricted entry-level licenses that aren't the
preferred entry into ham radio anymore anyway."

I keep thinking about mountains and molehills, but I guess
that's just me and my girlish Canadian naivete at work again...

I also keep wondering why your howls of outrage don't mention
U.K. Novice licensees. That, however, is the subject of another
thread.

I agree, NASA will not now give us a flight. But I also believe that
we should design some satellite that CAN be launched on NASA flights.
Perhaps they will not be P3D type systems, but I do NOT believe that
NO ham satellite can be designed that could not ride on a NASA flight.

It has nothing to do with the numbers ... it has to do with the TRUTH.
Hopefully AMSAT did NOT realize this situation when it made the QSL
cards and will take steps now to correct the situation. Afterall we
(AMSAT) do not (hopefully) act like our President (and lie).

>Which would you rather have:

I just want the AMSAT materials and QSL cards to tell the TRUTH ...
period. If we can not get our US regs changed to let our Novice class
hams participate on P3D, that is one thing. If so AMSAT needs to
change its advertising for P3D to be factual.

Pieter,

Call Fair Radio Sales in Lima Ohio, they had a rack mount power supply
(48 - 50 VDC) originally built for a commercial HF amplifier that should
fit the bill nicely. I was looking at this supply for the same type of
solid state amplifier project that you are building.

Hi all,
Could anybody possibly tell me how to make a crossed dipole for weather
sat reception as cheap as poss just the basic layout of one would begreat with
the mesurements.
Thanks a lot
Ian.

>W4SCO

That's not exactly true. Shuttle has carried a number of satellite payloads which have kick stages since Challenger (TDRS for one). They won't carry Centaur stages anymore due to the potential hazard, but they still carry sats up using PAM (Payload Assist Module) stages.

The problem for us is *money*. To Shuttle qualify the kick motor of P3D would cost a mint if it is even possible. And it isn't powerful enough to get from an orbit Shuttle can achieve to its final orbit anyway. It is designed to work from a GTO orbit, and Shuttle can't get there.

To change P3D to use a PAM would cost a mint (and PAMs cost a mint). And NASA can't give us a break on a satellite launch price anyway. That's because the Commercial Space Initiative forbids NASA to undercut private US launch companies (the Boeing subsidy act).

The cheapest thing NASA has to offer is a GAS (Get Away Special) can, and no propulsion systems at all can be carried in a GAS can since Challenger. So any free flyer released from a GAS can (and NASA has sharply restricted *that* too) would decay in a matter of weeks. Shuttle isn't even suitable for a LEO microsat launch.

NASA contracts out its unmanned launch activities now (Commercial Space Initiative again), so no free rides there either. The only possibility of a free ride from NASA would be on a developmental flight of one of the X prototypes currently being considered for SSTO usage. And there are no GTO flights manifested for them in the foreseeable future (GTO may never be reachable with a chemically powered SSTO). When ISS is fully operational, it may be possible to get them to kick something out the door, but you can be sure it won't have any propulsion system on board. The ISS is too expensive to risk that.

We can forget NASA as a source of a low cost ride to orbit. If we want a deal on a US carrier, it will have to be a commercial carrier. And none of them seem to be in the mood to give us a several million dollar subsidy. All of them except Boeing are scratching simply to stay in business. Boeing does have a partnership with the Russians to sea launch Zenits from a converted oil drilling platform. It might be possible to get a ride on a test flight from there, though the current plan is that they're going to start right out with operational commercial flights from day one. If there's a problem, they might have to fall back to a test series, and that might open a window for us. But the Zenit has a good track record from mobile launchers, and I expect it'll be fine.

What would have really been great would have been if the US had sold its Titan, Minuteman, and Polaris missiles for commercial launches instead of destroying them. (That's what the Russians did with the missiles they took out of ICBM service under START.) At government surplus prices, we might have even been able to afford our own launch vehicle. Think of the sat we could have orbited on a Titan. But the Boeing subsidy act wouldn't allow that. It might have cut into their new launch vehicle sales. (Even the Air Force has to buy new instead of using their old ICBMs, your tax dollars at work.)

>I lost the bookmark, and can't seem to find them.
>Can anyone help?

Sounds like the old ORTAG approach. That was a German
company back in the 70s which was going to launch using off
the shelf commercial parts from a launch site in Zaire. By off
the shelf, I mean they were using things like Mercedes power
window motors for directional control. Everything was to be
cheap and used in ordinary commerce. No expensive custom
parts were to be used. They had a standard rocket module
based on commercial pipe, and all launches were to be clusters
of that standard design assembled to fit the payload mass and
orbit requirements of a particular launch. Really slick.

There are nasty rumors that they were quashed by certain
black agencies whose nations didn't want such an independent
and inexpensive route to space. Their base in Zaire was overrun
by a rebel group, and their company president died under suspicious
circumstances. It could be that they failed for mundane reasons,
but if so, that has never been made clear.

The idea still has merit. Eschewing special exotic and expensive
parts can cut launcher cost very sharply. It also tends to cut
launcher performance somewhat, but perhaps not enough to
reduce the economic viability of the scheme. Use of cheap
mass produced components can allow efficiency to be less
while still keeping costs less too, IE if you're going to throw
something away, and you do that with any expendable, it
makes sense to throw something cheap away rather than
some exotic expensive part made of unobtainium to microinch
tolerances.

I am interested in amateur radio astronomy, and I am wondering if there are groups or individuals in the Connecticut area who practice this craft.
I am looking for some good advice on how to get started, (which gear, reciever, antenna, recorders, etc).
If you or anyone you know fits the bill, drop me an e-mail, luvfflyin@aol.com.
Thanks! -Bill C.

It depends of the mission. Most human science and earth science
flights are useless due to the low orbit (there is no need to get
higher). The shuttle is definitively capable of reaching orbits that
are stable for several years. Look at the Hubble Space Telescope, it
orbits for years between service/reboost flights. Getting a GAS
microsat on a HST service flight would give an orbit, which stays up
for several years (to avoid any risks for collisions between the
microsat and HST in the future, the microsat would have to be launched
on a slightly lower orbit than the final HST orbit).

904. Help with InstaTrack

Newsgroup: rec.radio.amateur.space
Date: 1998-04-19 00:00:00 UTC
From: Joe Schlatter <w4hh@3wave.com>
Message-ID: <6he754$5ks@enews1.newsguy.com>
Source record: 16330

My hard drvie crashed recently and, following good technical practices, I dived into the computer with the power on to see what was the matter. Dropped a screwdriver on the motherboard and lost it, too. No matter. I got a NEW Pentium motherboard, AMD K6 that runs at about a zillion MHZ, new HD, etc, and built a new computer out of the deal.

I re-installed all my software and now InstaTrack is doing something wierd. It works just fine (running Windows 95; IT runs in the DOS mode) but, when I bring up the map screen, I get garbage across the bottom of the display.

Normally, when viewing the map screen, IT shows the position data for the satellite being viewed, with the range, azimuth, etc., racing along as the satellite moves. What I get is garbage that looks like the satellite data that is suposed to be there. Parts of the garbage race along just like the satellite data would.

On the IT intro screen, where it shows several satellites across the bottom, it works normally. The garbage only shows up when I am using the map tracking screen.

Anyone out there have any fixes?

TNX ES CUL,
Joe

I had a home-built turnstile for the uplink, and it worked very well. Problem was, it attracted a lot of unwanted attention from the neighbors (rather unsightly...) Switched to the eggbeater about 1-1/2 years ago and love it. Much less obvious, and comparable performance. I even work AO-27 with it and a dual-band HT!

I have a Motorola SP50 UHF Radio used only 5 times in Brand Spankin' New Condition with antenna, full capacity Nicad pack & drop-in rapid charger. This is a two channel radio and will transmit from about 400mhz to 470' something mhz. The radio is about 1 year old if that and is a full powered radio with the option button programmed for low powered 1 watt setting when full power is not needed.

No reasonable offer will be refused.

I would be willing to trade it for a Yaesu FT50R, ICOM 706MarkII or any HF base radio that is is either last years model or current model.

Remove the 'X' from my EMAIL address to reply. Send all offers to me in email: xandrew@tropicom.net

Well, you should have received 2 copies of it by now.... when I went to send
it from AOL yesterday they were temporarily not accepting file attachments, so
I sent it from my Worldnet account. Forgot to cancel the AOL upload, so that
one got sent this morning as well....

>I'm hoping to build one of these for use in working sattelite downlinks,
>since that is about the extent of my lowband activities these days. Also,
>could you tell me about how much tuning range you have, with respect to
>minimal SWR??
>
>

I never tried transmitting on it, so I really can't say. I only used it for
receiving the downlink. I would imagine it would be pretty broad-banded, with
that large a conductor. I believe that full-wave loops are also inherently
broad-banded, regardless of conductor size, but don't quote me on that.....

I'm not sure that a microsat at the HST servicing altitude would last very long.
Hubble has to come down a bit to meet Shuttle for a servicing mission using
its own reaction system. There's still enough drag at servicing height that the
orbit of a small body with a low sectional density would rapidly decay.

Hubble's mass and SD let it dwell longer (same reason MIR can stay up but
toy sats they kick out the door rapidly decay). I don't think that little hollow cubes
would fare very well at Hubble servicing altitude. (I think that's roughly 260 km.)

Hi there, it sounds like the video mode used by the programme does not like being run in a window under win95, you could set a shortcut to run in dos mode only or alternately get a copy of free winorbit that runs very nicely under windows 95.

What I want to know is this ... HOW can they launch a new FM bird if we (AMSAT) can NOT launch our bird (P3D)? In other words how do the small guys do it (launch) when we (the Big guys) can NOT. Does not compute for me.

Or maybe just maybe we (amsat) should hire Arizona State University to build and launch our next satellite.

Source record: 16347

Hi,
We're working on our own satellite project just down the road from ASU (Tucson, University of Arizona), but we won't be up for several years (2001 or so).
Anyway, I just met with some of the ASU students this weekend, and latest word is that they will be going up in the Summer of 1999. The spacecraft is mostly ready, and they just have some final work to do before the launch.
Now, to address W4SCO's question: ASU was promised a launch opportunity from Orbital Sciences way back in 1993 (that's what started the project). Orbital said that if ASU could build a spacecraft that weighed less than 10 lbs (and subject to some volume constraints), they would launch it. Apparently there was a little bit of space left between where the "real payload" interfaces to the launch vehical where you can slip in a very small satellite with minimal impact.
Now, with that said, ASUSat is a 10lb satellite that you can hold in your hand, and Phase 3D is anything but. P3D is about the size of a room, and weighs much, much more -- so much, that it requires its own launch vehicle, and is a very expensive ordeal since you don't have the government or Corporate money to ride along with. Orbital Sciences doesn't even have a vehical which could put Phase 3D in orbit!
Also, I might add that ASUSat got "bumped" from the manifest several times along the way, which also impacted its design.
This is why Phase 3D does not currently have a ride to orbit. It should be very easy to understand if you can see what is required in terms of Physics and economics to put these things in orbit.

Another FM bird to be on the watch out for is "SEDSAT" for which the launch has also been delayed, due to the primary payload, Deep Space 1. It was supposed to launch July 18th this summer, but now won't be any earlier than October. You can find more about SEDSAT at http://www.seds.org/sedsat/

Also, as a last note, you can read about the developments of our project (UASat, University of Arizona, Tucson) at http://www.physics.arizona.edu/ssp/. We're in the very preliminary stages right now, but things are moving along.

As far as I know, the HST has _no_ chemical reaction systems. It has
some reaction wheels (and some electromagnets) for attitude control.
You are right that the HST comes down to the service altitude (by
drag), but after the service, the HST (and consequently the Shuttle)
is reboosted to a safer altitude using the small shuttle engines
(which use storable propellant).

The low altitude (less than 1000 km) is a very severe compromise from
scientific requirements point of view. The atmosphere has some glow
even at this altitude and half of your field of view is blocked with a
very bright object. The orbit period is also very short and long
exposures have to be made at multiple orbits. An astronomical
satellite should have a much higher orbit, but then, it would not be
serviceable with the shuttle.

>Hubble's mass and SD let it dwell longer (same reason MIR can stay up but
>toy sats they kick out the door rapidly decay).

A large proportion of the Progress supply ship load is fuel for
reboosting MIR. Without it, the Mir would come down in a few months.
Look at the orbital elements of Mir and there are frequently big jumps
in them due to the reboost. Any satellite hand launched from the Mir
will not be reboosted and thus decay quite quickly. The same would
happen to Mir if several Progress resupply flights would fail in a
row.

Who takes the challenge?

There should be many enough CE programmers around that
some of them might be found in the amateur radio community.
So far I have not seen any amateur radio programs for
Windows CE at all.

For Your info I have got a HP620LX color screen palmtop
that I am quite impressed of and that does not happen too
often in this computer society...
Of course, though I have had it for a couple of weeks now
I still have not got my cellular PCMCIA modem working with
it but I think I am quite close now...

I would be interested of Your experiences of Windows CE.

One word of caution, a lot of telecom power supplies float battery banks and aren't designed to handle heavily modulated (varying at syllabic rates)loads. Others are designed to run banks of equipment without batteries, and experience a fairly steady load without appreciable speech modulation because their big load is really made of an awful lot of small ones, and their modulations don't correlate.

Powering a big class A/B power amp handling a single SSB or OOK Morse signal is a particularly interesting challenge for a switch-mode power supply design. A lot of available supplies could misbehave, and MRF154s are awfully expensive....

Cheers
David GM4ZNX

Well, I can hear myself out of a jpole......barely..:-)

I really do not like how the Doppler compensation is dialed up in the FT-847.....its WAY to fine, you feel like you are cranking that little knob forever.

I choose the turnstile because it could be made so portable. I am using a 8' telescoping tent pole for the mast and bungee cords for the guys to tent stakes. The improvement from a longwire loop was dramatic. The longwire loop yielded S3 to S5 noise with a signal in there somewhere, the turnstile yielded NO measurable noise on the S meter and a S3 to S5 signal. It is because of this that I believe there is room in the design for a pre-amp.

I am currently building a portable 2 meter turnstile with a base made from common copper plumbing.

NEC4WIN95 has proven to be valuable, and will register it......IF I can ever figure out how to create gamma matches with it.

Have Fun!

Has anyone experience using an R7 HF vertical for the ten meter downlink on mode A sats?. I only uplink 5 to 8 watts CW to RS-12 and have no problem hearing my signal even without a pre-amp on my old kenwood TS-520 which is pretty dead as far as reception is concerned.

I have always read that a vertical exhibits fading as the sat passes overhead, but haven't found that to be true with the R7 (the highest pass according to WinOrbit was 89 degrees, pretty straight up!).

I was interested in building a loop, the attic seems to be the perfect place to put one! Any comments on the advantages?

How about PalmPilot? Lots of apps for the PP but few Ham Radio Apps.
WinCE is far behind PP in market share. Excellent development tools are
out there too.

934. What happened to MIR?

Newsgroup: rec.radio.amateur.space
Date: 1998-04-21 00:00:00 UTC
From: Steve Porter <sporter@mail.snider.net>
Message-ID: <353D0E78.2D62@mail.snider.net>
Source record: 16360

We haven't heard anything of MIR on 145.985 since Sunday nite.

Has anyone else noticed this?

Does anyone know what's going on?

We can't find any information about any change that would have
affected our reception.

Any ideas? Anybody know anything regarding this?

Thanks!

Hi Christopher,
If you're referring to the UASat project, much of the technical information isn't yet online. There is also some stuff which is technically online, but there are no links to it (there are some powerpoint presentations in http://www.physics.arizona.edu/ssp/presentations/ -- this is from our Conceptual Design review in November.)
Much of the rigorous engineering design is "yet to be done" as we haven't been at this for long yet.
We'll keep everyone posted though!

> LEO microsat launch.

Hi -- this has been responded to before, but I'd just like to add some details gained from my recent analysis. Our satellite is being designed to launch from the Shuttle's Hitchhiker Ejection System (out a GAS can). Having done some analysis for that, based on a 400km altitude and a 51.6 degree inclination orbit -- and two other important parameters, satellite mass and cross-sectional area, which determine the ballistic coefficient -- we found that our satellite would be up approximately for a few days less than a year. While I'm at it, I'll just post all my analysis stuff here for reference:

Mass ~65Kg
Area 0.25m^2 (small, 50cm tall/diameter cylinder)
Orbit Timeframe -- fall 2000 (just past solar max)
Inclination 51.6 degrees (International Space Station Orbit)

Initial Altitude Time till re-entry
325km 94 days
350 144
375 231
400 362
425 1.6yr

Small changes in mass and area can produce fairly drastic changes in orbital lifetime, so all this must be considered when doing the analysis. These were done with the licensed (Professional) version of Satellite Toolkit, V4.0.3.

So, the long answer to the question is that a satellite in LEO (shuttle) orbit will be up much more than a couple of weeks if deployed at the higher altitudes of the Shuttle orbits.

PS -- Our satellite project, UASat, is a recent development, and we hope to have it in orbit by 2001 or so. You can read more about it at http://www.physics.arizona.edu/ssp

I'd like just to be able to actually hear MIR ONCE! I've listened and listened at the times I've gotten for passes over Seoul and sometimes I hear some packet stuff, which I was told is their Robot for when they aren't available to talk, but I've never been able to hear any voice... Maybe I'm just at an inconvienient spot for them to talk to.. maybe they're always busy when they pass over Seoul..

Co> Maybe I'm just at an inconvienient spot for them to talk to.. maybe
Co> they're always busy when they pass over Seoul..

Hello there, yes they do seem to have been off the packet radio for a while.
I have been monitoring everyday for months and previously they seem to go off at
around 10pm gmt here in the uk but this time they have gone off for a while
longer., possibly it could be that they are making adjustments for the MIREX
experiment on the 27th april from morning to night where they packet -contact
schools around the world (worth watching). Usually I hear them talking on
143.6250 nfm, this is their main talckback channel to russia (and it's all in russian)
You may not hear them on this freq as by the time they get over seoul they are no
longer i range of russia and therefore not talking.

Hope this helps.

Hi All,

Does anyone know what the boom-to-boom cross-boom spacing is for the big 70c/2m KLM circular satellite antennas? These are the 18 ft. boom models. I don't know what the proper names are. I need the papers on them. Thanks in advance!

...Harry, KC5TRB in Tulsa, Oklahoma

RS-10/11 uses dipole antennas, which are linearly polarized.

Circular polarized antennas on the ground are mismatched
all the time, but reduce fading. They are a good compromise
for someone who doesn't want to build a complicated antenna
system that can track changing polarization--Zack W1VT

Hi, Andy!

That "packet stuff" is what we're after here. I've never heard voice comms on that freq and don't know if they ever do voice comms there since the 70cm repeater is operational. We've been able to copy the packet up until Sunday, but since then, nothing. We've got a terminal dedicated full time at the moment in case we're not around during a pass so we can at least tell if things are operational.

73's and good luck.
Steve

PS - Have you tried listening to 143.625? That's their voice comm freq back to the RSA.

I've just gotten into the hobby of monitoring Mir during its passes over my area (Eugene, Oregon, USA). I've been picking up orbital elements for Mir from:

http://www2.gsoc.dlr.de/scripts/satvis/satinfo.asp?SatID=16609

I'm using SatTrack 3.1 for UNIX to run orbital predictions. So far it's been amazingly accurate; if their packet beacon is on I've picked up and lost the signal at the predicted times, and can usually monitor it almost horizon-to-horizon even for low-elevation passes.

They apparently turned off the 2-meter radio yesterday (April 21) which I believe was due to a scheduled EVA by the cosmonauts planned for their day of April 22; I did not receive any signals during the passes I monitored. However, I have picked up the 2-meter packet transmissions again during their passes today, and also monitored Andy Thomas trying to call an amateur station in the U.S. this morning (about 1830 UTC).

According to the information at:

http://www.geocities.com/~ik1sld/mirex.htm

The cosmonauts are usually asleep from 2300 to 0800 Moscow time, or 2000 to 0500 UTC, and the most likely time for them to be monitoring the radio is usually in their evening hours before 2000 UTC. Reports are that their schedule is very busy lately and voice contacts are rare, but people are leaving plenty of packet messages.

They don't actually come with a cross-boom... you have to supply
your own. Spacing is not overly critical. Once upon a time
I used a 5 foot crossboom, but am now using 8 feet.

Joe: During a pass, many stations, especially here on the East Coast, will try to connect to Mir without monitoring the packets to see if anyone is already connected, so what you are seeing is *in fact* a "pileup" as you put it. Some folks are also using MIr as a digipeater. I have "connected" to Mir twice, but do to the QRM, was unable to send a message or once, even disconnect before the station went over the horizon. One suggestion though, is to make up a short message to the crew before time, a one-liner like" Greetings and best wishes from Joe Walker, Amateur Call _____". Save it as a simple Text file, and when you successfully connect to Mir, just do a "Send File____" and then disconnect. Also, try connecting during "off-peak" times, say for example if you have a fairly high pass at 2:00 AM Local Time. Stay sharp because you WILL connect the first time you are not completely prepared (Murphy's Law). Good Luck !

I have experience with a home made 2 meter egg beater and one on 10 meters. Best I could figure
from the crude measurements as compared to a single diamond quad it has a 3 DB gain and is omni
directional. It must compress the Horizantal plane to do that, and in so doing lowers the angle of
radiation I suspect.

I replaced a single diamond quad for 2 meters with the egg beater and every one in town said
my signal came up. I did not have a VHF SWR meter whern I built it and later found out it is
too long, but worked well anyway.

I made some crude tests against a 10 meter diamond quad and the results are in my antenna
program. If you want to take a look at what I did it is in an free antenna program that I wrote
and is downloadable at my web site. If you go there take the download link and the the antenna
program. I would send you a direct link rather than send you around the horn except I like to know
how many hits I get for the programs.

Where is the best place(s) to get current sattelite info; operational status, keps, frequencies, etc. Everything I've run across so far is out of date.

I've tried subscribing to the various AMSAT lists, but have not received anything from them yet. As it stands, I don't have a real good source to tell me which sats are up, down or permanently defunct. Any help would be greatly appreciated.

After hooking up with Mir several weeks ago, I'm well and truly intrigued by this activity, and want to know more...

Thanks to all,

Ron R.

Over Europe Mir uses duplex, 145.800 down, 145.200 up. The packet mailbox
IS working, we see it on over the U.S. all the time. Andy HAS been working
schools recently, the cosmonauts hardly ever get on in voice mode. Some crews
like to talk, some don't. This current crew doesn't seem to like to talk much,
except for Andy. I have not heard him on voice yet but he's been making
contacts mostly with schools, they have a backlog and are trying to catch up
talking to the kids.

Mir moves fast! Your tracking mechanism would have to be superb!

I ran into the "Earth and Moon move" issue with a telescope viewing the moon at high magnification! It was blurry because of the thousand's mile an hour equivalent trip I was taking across the surface.

Things to think about!

Christopher Cox

Most stuff (Ham Sat's) that I can see goes up on 2 meters save AO-10, which
if your yagi is pointed correctly would have no problem listening to.

RS-12 is presently full-time Mode KA (15m and 2m up / 10m down), and
working quite nicely, thank you!

968. RS-16 Beacon 1 is active

Newsgroup: rec.radio.amateur.space
Date: 1998-04-24 00:00:00 UTC
From: rrickets@ix.netcom.com
Message-ID: <6hqfj2$ota@sjx-ixn4.ix.netcom.com>
Source record: 16394

Copied RS-16 Beacon 1 (435.504 MHZ nominal) for about 5 minutes today at 18:05Z. Doppler forced retuning about 8 KHZ overall during the transit.

Beacon consisted of repeated CW RS16 ID and something else I couldn't catch; my CW speed isn't all it could be... Anyway, elevation was about 16.5 degrees here, but the signal was strong, S9+.

I didn't know that it was operative yet... or is it just the repeater that isn't turned on???

Comments??

Ron Ricketts

Hmmmmm..... well, I haven't tried it since late September, so maybe it's
time to un-winterize my station and get back on the bird!

May "see" you there! I usually try to downlink around 29380.....

Just getting back into satellite work and looking for some ideas as to what antennas seem to be most favorable to work RS-12 and RS-15.

Any ideas or suggestions would be greatly appreciated.

73,
Wayne Ginther

I wish to buy a control box for a Yaesu G-250 rotator. At worst, I will buy a complete (working) G-250 if you have one for sale. UK-based sellers only please.

Does anyone know if it is possible to control a G-250 via the RS-232 port of a PC?

Reply to nemco@itl.net please.

979. FT-50 programming

Newsgroup: rec.radio.amateur.space
Date: 1998-04-26 00:00:00 UTC
From: Will White <wcw@asu.uswest.net>
Message-ID: <3543D417.DABA6CF7@asu.uswest.net>
Source record: 16405
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.amateur.equipment

I am trying to program my FT-50 to work AO-27 as described in QST a few months ago. The problem is, I can't figure out how to make cross-band split memories. No where is this described in the manual. How can I create a memory channel with a 2M transmit frequency and a 70cm receive frequency? I have tried using the VFO-duplex mode, but that is cumbersome, to says the least, when it comes time to correct for doppler.

980. FO-20

***** DON'T PANIC!!!! *****

***** READ ENTIRE MESSAGE FIRST!!!! *****

The following message is an announcement of a 30-day discussion period on news.groups to precede a non-binding opinion poll which, depending on the results, MAY lead to a formal Request for Discussion (RFD) to reorganize the rec.radio.amateur.* newsgroups. NO VOTES ARE BEING TAKEN AT THIS TIME, and any binding vote that affects the rec.radio.amateur.* newsgroups will not occur for many months into the future, if at all. Please read the entire announcement carefully before replying or following up.

rec.radio.amateur.* Vote of Confidence

Contents:

Q: Who is doing this?
Q: How may I join the rra-wg?
Q: Why are we doing this?
Q: What are we doing?
Q: More to the point, why are we "kicking over this hornet's nest?"
Q: Why do you want to change the newsgroups again?
Q: Who are you to tell us what to do with "our" newsgroup?
Q: How long ago were each of the rec.radio.amateur.* newsgroups created?
Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and rec.radio.swap included in this proposed opinion poll?
Q: Where can I obtain a copy of the original newsgroup charters?
Q: Where can I find out more information about the Usenet RFD/CFV process?
Q: I don't want any of the newsgroups to change. What should I do?
Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?
Q: I support some of the newsgroups for amateur radio, but not others. What should I do?
Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?
Q: I would like new newsgroups to be created, what should I do?
Q: I have no opinion, what should I do?

Q: Who is doing this?

The rec.radio.amateur.* Working Group (rra-wg@theporch.com, which initiated the last major reorganization in 1993) is the point-of-contact

for questions about this proposed opinion poll. Principal members are Paul W. Schleck, K3FU, and Jeffrey Herman, KH2PZ. Though not an rra-wg member, Gary Coffman, KE4ZV, also endorses this proposed opinion poll. The proposed opinion poll will be conducted by an unbiased third party from the Usenet Volunteer Votetakers (UVV), Jeremy Billones (billones@primenet.com).

Q: How may I join the rra-wg?

Anyone who volunteers may join the rra-wg. The rra-wg has always solicited volunteers from when it was created in 1993 (originally named rra-reorg) to draft an RFD to reorganize the rec.radio.amateur.* newsgroups (and continues to serve as an advisory group for FAQ maintainers and new newsgroup proponents). You may join the rra-wg by subscribing to its mailing list.

The automated list manager address is

listproc@theporch.com

Use this for subscribing, unsubscribing, getting archived info, getting the FAQ message, changing your address, etc.

To subscribe, send a message to this address with "subscribe rra-wg <your name>" Similarly, to unsubscribe, replace "subscribe" with "unsubscribe"

The list owner address is

listown@jackatak.theporch.com

Use this address only when there is a problem which really truly can't be resolved otherwise.

Q: Why are we doing this?

Discussion on the rec.radio.amateur.* newsgroups shows that there is a difference of opinion about the current newsgroups and their charters. Assertions on one side of the argument that the charters were voted upon by the readers have been countered with assertions on the other side that the votes took place years ago, by a very small minority of the current readership. There is also the strongly-held opinion among some that we have "too many newsgroups." The following is a sample posting from the discussion thread on rec.radio.amateur.misc that led to this proposed opinion poll (the entire thread may be viewed at DejaNews, http://www.dejanews.com/):

Q: What are we doing?

As a preliminary (and perhaps even diverting) step to an RFD (which would be very laborous and time-consuming, and perhaps unnecessary), we propose to conduct a Straw Poll, or "Vote of Confidence" (similar to the vote of confidence for a Prime Minister made by British Parliament, or a non-binding resolution of the U.S. Congress). We do it Usenet-vote style (utilizing a neutral vote-taker from the UVV) with an RFD and Call For Votes (CFV) period. During the RFD, we have discussion pro and con about each newsgroup and its charter. During the CFV, a vote is taken where a "Vote of Confidence" yeah or nay for each newsgroup, as currently constituted and chartered, is given by each voter (YES/NO/CANCEL/ABSTAIN votes are valid).

What votes mean:

YES: I support the existence of this newsgroup and its charter

NO: I believe that this newsgroup's existence or its charter should be reconsidered in a future RFD/CFV

CANCEL: Delete any previous votes I made concerning this newsgroup

ABSTAIN: I have no opinion concerning this newsgroup

Each newsgroup that does not pass a vote of confidence by Usenet voting standards (2/3 and 100 vote majority of YES versus NO votes) may be referred to the Usenet newsgroup creation process where their deletion or modification (based on a rough consensus of the 30 days of discussion and how much they lost in the vote of confidence) is proposed. Each newsgroup that does pass a vote of confidence will have its charter, and justification for existence, reinforced to the readership (as the current readership voted on it).

Q: More to the point, why are we "kicking over this hornet's nest?"

Sometimes hornet's nests can get big enough that they wind up falling down anyway. As shown in the thread above, there are significant undercurrents of disagreement over the current newsgroups, their charters, and even the suggested guidelines and rules of net-etiquette that many on the newsgroups advocate. If the proposed opinion poll shows strong agreement with current practices, then that would help reduce (though not eliminate) newsgroup arguments on the subject. If, however, the proposed opinion poll shows strong disagreement, then it's probably better that we know that right away, and take steps to fix the current situation before it degrades any further.

Q: Why do you want to change the newsgroups again?

Only some of the proponents of this proposed opinion poll wish to change the newsgroups. Some wish to simply have the current newsgroups and their charters reinforced. All of the proponents agree that an up-to-date opinion poll of the readership is desirable at this time. Whatever future actions will be taken will be determined by the results of this proposed opinion poll.

Q: Who are you to tell us what to do with "our" newsgroup?

One answer is that on Usenet, no one "owns" an unmoderated newsgroup. Newsgroups are voted into existence by a democratic process to determine consensus (and lack of significant objection) for using shared network resources to support them. All of the existing rec.radio.amateur.* newsgroups passed such a vote at some time in the past, and should pass such a vote again if there is strong support for their continued existence.

Another answer is that this is just a non-binding opinion poll of the readership to determine a consensus, if any, for making changes. It would still be necessary to undertake a formal RFD/CFV process to change any Usenet newsgroup (and that was always possible, anyway).

It should also be emphasized here that no individual rec.radio.amateur.* newsgroup is being singled out. Rather, a consensus of the readership concerning ALL rec.radio.amateur.* newsgroups is being sought.

Q: How long ago were each of the rec.radio.amateur.* newsgroups created?

1972 (or possibly earlier, this date is when UCSD joined the ARPANet):

Info-Hams (original ARPANet mailing list at Simtel-20, continues today
at UCSD as a gateway of rec.radio.amateur.misc)

1979:

Creation of Usenet News at Duke and UNC

early 1980's:

fa.info-hams (fa = "From ARPANet") *
net.ham-radio (pre-Kent Paul Dolan "Great Renaming") *

mid 1980's-1991:

rec.ham-radio *
rec.ham-radio.packet *
rec.ham-radio.swap *

1991 Reorganization:

rec.radio.amateur.misc
rec.radio.amateur.packet *
rec.radio.amateur.policy
rec.radio.cb
rec.radio.swap

1992/3 Addition:

rec.radio.info

1993 Reorganization:

rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.misc
rec.radio.amateur.policy
rec.radio.amateur.space

1996 Additions:

rec.radio.amateur.dx
rec.radio.amateur.boatanchors

* = obsolete

Current newsgroups covered by this proposed opinion poll, and the years
in which they were created:

rec.radio.amateur.antenna (1993)
rec.radio.amateur.boatanchors (1996)
rec.radio.amateur.digital.misc (1993)
rec.radio.amateur.dx (1996)
rec.radio.amateur.equipment (1993)
rec.radio.amateur.homebrew (1993)
rec.radio.amateur.misc (1991)

rec.radio.amateur.policy (1991)
rec.radio.amateur.space (1993)
rec.radio.info (1992/3)
rec.radio.swap (1991)

Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and rec.radio.swap included in this proposed opinion poll?

Though one level up in the rec.* hierarchy, these newsgroups are principally used by readers of rec.radio.amateur.*, and their fates would substantially be decided by any significant reorganization of the rec.radio.amateur.* newsgroups. Though created by a rec.radio.amateur.* reorganization, rec.radio.cb is not included in this proposed opinion poll.

This announcement has been cross-posted to all rec.radio.* newsgroups (except for rec.radio.broadcasting and rec.radio.info, which are moderated). In addition, the following individuals were consulted prior to this announcement (note that consultation does not necessarily imply endorsement):

Richard Eckman, KO4MR, Proponent of rec.radio.amateur.dx
Brian Kantor, WB6CYT, Administrator of Info-Hams/Ham-* mailing list gateways of rec.radio.amateur.* newsgroups at UCSD
Ian Kluft, KO6YQ, Proponent of 1993 rec.radio.amateur.* reorganization, former rec.radio.amateur.* FAQ Maintainer
Jay Maynard, K5ZC, Proponent of 1991 rec.radio.amateur.* reorganization
Brian Short, K7ON, Moderator of rec.radio.info
Rick Stealey, K2XT, Proponent of rec.radio.amateur.boatanchors

Q: Where can I obtain a copy of the original newsgroup charters?

ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.info
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur-reorg
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.dx
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.boatanchors

Q: Where can I find out more information about the Usenet RFD/CFV process?

ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Create_a_New_Usenet_Newsgroup
ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Format_and_Submit_a_New_Group_Proposal
ftp://rtfm.mit.edu/pub/usenet/news.groups/Guidelines_on_Usenet_Newsgroup_Names

Q: I don't want any of the newsgroups to change. What should I do?

Express your opinions on news.groups (the default followup newsgroup for this message) and vote "YES" for all of the existing rec.radio.amateur.* newsgroups when the proposed opinion poll occurs (in 30 days time).

Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?

Express your opinions on news.groups, and vote "NO" for all (or all but one) of the newsgroups when the proposed opinion poll occurs.

Q: I support some of the newsgroups for amateur radio, but not others. What should I do?

Express your opinions on news.groups, vote "YES" for any newsgroups that you wish to remain unchanged, and vote "NO" for any newsgroup you wish to have reconsidered in a future RFD/CFV when the proposed opinion poll occurs.

Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?

Since the proposed opinion poll is for both the existence of given newsgroups AND their current charters, you should express your opinions on news.groups and vote "NO" for that newsgroup when the proposed opinion poll occurs. Again, this is a non-binding opinion poll simply to determine if current newsgroups should be considered for modification or deletion, not a vote to actually modify or delete these newsgroups.

Q: I would like new newsgroups to be created, what should I do?

Creation of new newsgroups is not being considered by this proposed opinion poll. A future RFD/CFV would have to be initiated to do this. You are, of course, welcome to express your opinions concerning new newsgroups on news.groups.

Q: I have no opinion, what should I do?

You may wish to read the following 30 days of public discussion on news.groups about this proposed opinion poll to develop your own opinions. Discussing your resulting opinions on news.groups may help further develop your opinions, or those of others.

If, after reading and participating in the public discussion, you still remain undecided, you may choose to abstain from the proposed opinion poll. You may do so informally by not participating in it at all, or formally by explicitly voting "ABSTAIN" for all of the newsgroups when the proposed opinion poll occurs.

Watch for an announcement of the STRAW POLL (CFV) in about 30 days. Questions to rra-wg@theporch.com.

Christopher,

FO-20 is still working steadily.
I do not know why it is not listed in AMSAT pages.
But you can find it in JARL pages.
See below

http://www.jarl.or.jp/English/5_Fuji/ejasmenu.htm

Im in the same boat. Here in SE virginia NO ONE is intereseted is Sats-except
me!!!! So, I need a current source for orbital elements too. Lmme know if u
get a good answer! Also, what is the easiest Sat tracking pgm around that
allows easy updating of sat elements??? Tnx.

I couldn't figure it out, so I bought the ADMS-1D software.
Works great. FYI, when it's done right, both the "+" and "-" repeater
shift indicators are on.

I did see a post in the AMSAT archives (sorry, I can't find it), that
alleged that it was documented in the manual and involved pressing the PTT
button while standing on your head and shouting, "GET IN, GET IN" or
something like that.

* FUJI-OSCAR-29 NEWS *
======================
The FO-29 satellite was switched into Mode JA on 1998-Apr-20 at 0700 UTC
because the command staion detectd 2 bit errors in the on-board-computer.
Resetting and reloading software into OBC will take a while, and the
satellite will remain in Mode JA until that time.

[Info via Kazu Sakamoto, JJ1WTK]

* OSCAR-11 NEWS *
=================
In response to many requests for information regarding methods of decoding
OSCAR-11 signals, Clive Wallis has added a package of information to his
OSCAR-11 Web site regarding this topic. The web site also contains some
software for capturing data and decoding ASCII telemetry and WOD. There
is an archive of raw data (mainly WOD) for analysis, which is continually
being expanded as new data is captured.

The web site also contains some audio files, including a recording of the
Mode-S beacon which plays for 20 seconds. The other audio files are
examples of each type of data transmitted by OSCAR-11, and each one plays
for about ten seconds. All the audio files are zipped so that they can
be played off-line. They should help listeners identify the various
types of data, and give an indication of the signal quality required
for successful decoding.

The URL of Clive's OSCAR-11 Web page is:

http://www.users.zetnet.co.uk/clivew/

When the previous OSCAR-11 report was written, ground control operations
were taking place to investigate a "shut down" that had occurred a few
days previously. These operations were successful and normal service

has been restored. During the period 1998-Mar-21 to 1998-Apr-15, excellent signals have once again been received from the 145.826 MHz beacon.

Reception reports of the Mode-S beacon have been received from Mike, WL7BQQM, Ed K9EK, and Jim KK3K. These reports were all received after the "shut down" occurred, indicating that beacon is still OK. Many thanks for those reports.

Since the "shut down", the telemetry indicates that there is a reduction in the 14 volt line current of about 50 mA and a reduction in the +5 volt current of about 25 mA. The reason for these changes is not obvious as the status telemetry does not show that any units have been switched off. The only obvious change in status telemetry is that the four bits associated with the CCD camera integration period and gain have changed from ones to zeros. The camera power is OFF (unchanged).

For several years, Clive has been monitoring the efficiency of the power conversion process on OSCAR-11 (the ratio of power output to power input).

Power input = Sum of solar array currents * Array voltage

Power output = Battery volts * (Charge current + 14volt line current)

The efficiency calculated in this way has usually been around 80 to 85%. However since the "shut down" it has fallen to around 65 to 70%. Clive welcomes explanations or suggestions regarding this anomaly.

A new WOD survey of channels 1, 2, 3, 61 (magnetometers) dated 1998-Mar-19 has been started. Anyone using this survey should note the unusual starting time of 16:00:05 UTC.

The operating schedule is unchanged.

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

There are also additional status blocks after each bulletin is transmitted, and between ASCII TLM and WOD.

The Mode-S beacon is on, transmitting an unmodulated carrier, but telemetry indicates that it has partially failed, and delivering only half power. This beacon is a useful test source for those testing Mode-S converters in preparation for the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing. Any reports of S-Band beacon reception should be directed to Clive Wallis at: g3cwv@amsat.org.

The 435.025 MHz beacon is normally off. However, it can sometimes be heard when the satellite is being commanded by ground control, ie.

within range of Guildford, UK. When the 435 MHz beacon is transmitting, the 145 MHz beacon is normally off. The data transmitted is mainly binary.

[Info via Clive Wallis, G3CWV]

* MIR SCHOOL DAY PLANNED *
==========
Dr. Dave Larsen, N6CO, of the MIREX team has announced a special MIR School Day communications test on 1998-Apr-27 between 1000 UTC and 2300 UTC. The purpose of the test is to let as many schools as possible communicate their position and brief message via MIR. To date, there are about 30 schools signed up, with only seven being outside of the USA.

As was demonstrated during the 1998-Mar-11 test, as many as 50 schools in a single footprint can probably participate and still have an excellent chance of being seen. If you can set up your TNC, and modest 2m FM transceiver to an omni antenna at a school, then you are welcome to participate. For details, see the previous announcements on the subject, or browse http://web.usna.navy.mil/~bruninga/mirex.html.

[Info via Bob, WB4APR]

* GPS THREAT TO 1.2 GHz BAND *
==========
The ARRL Letter, dated 1998-Apr-04 stated that the second civilian frequency for the Global Positioning System (GPS) could wind up within Amateur Radio's secondary allocation at 1.2 GHz. A decision on whether the new, second frequency will be 1205 or 1250 MHz is expected to be made in August. An allocation at 1250 MHz could mean the end of Amateur Radio in the band between 1240 and 1260 MHz. The Amateur 23-cm band runs from 1240 to 1300 MHz.

In February 1997, the Departments of Transportation (DOT) and Defense (DOD) announced an agreement assuring civilian GPS users of a second frequency, referred to as L5, and considered essential for critical civilian GPS uses. According to a DOD news release, the White House Commission on Aviation Safety and Security, chaired by Vice President Al Gore, "called for the establishment of a second civil frequency as part of a broader program to maintain US leadership in aviation and satellite technology."

Further information on this subject is available at:

http://www.defenselink.mil/news/Feb1997/b022797_bt095-97.html

989. CORRECTION: Send STRAW POLL Discussion to rec.radio.amateur.misc

Newsgroup: rec.radio.amateur.space
Date: 1998-04-27 00:00:00 UTC
From: pschleck@novia.net
Message-ID: <6i32liior1@newscene.newscene.com>
Source record: 16415
Cross-posted to:
rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.noncomm

Based on thoughtful feedback from Kathy Pascoe (kpascoe@ford.com) and Yves Belleveuille (yan@storm.ca) on news.groups, I've come to the conclusion that rec.radio.amateur.misc would be a better followup target for this straw poll discussion.

I sent the original copy (complete with exact headers) to several experts, including past newsgroup proponents and our volunteer UVV votetaker for review a week prior to posting, but unfortunately no one (including me) noticed that a followup to news.groups might generate controversy. As helpful as the standard FAQ documents on newsgroup creation were, they weren't (in my opinion, at least) sufficiently clear regarding the inadvisability of conducting informal meta-discussion on news.groups. It's also sometimes hard to figure out what's appropriate on what newsgroup by observing others. According to Kathy and Yves, news.groups is an appropriate target for discussion in response to a formal Usenet Request for Discussion (RFD), but informal pre-RFD discussion (including straw polls) should probably be conducted in an appropriate home newsgroup.

Since more than one person has offered this feedback, and in a thoughtful and convincing manner, I'm posting this correction, and asking that followup discussion on this straw poll (which should commence, as scheduled, in 30 days time) go to rec.radio.amateur.misc.

Look to Springfield Ohio if Dayton fills up. You will need transportation,
but its only about 30 minutes out...TOPS....Cake if you have a rental car.

Hi all,
Yeah I know I ask a lot of questions...but ya don't learn without them.
Anyway, I see from a list of MIR transmission frequency's that I got from
a nasa source that MIR has a video downlink frequency. Does anybody know
if it is possible to recieve this ?. Has anybody tried and if so how ?

Thanks in advance.

Ian.

Good luck ! We have openings in Muncie, only 90 miles away :)

Seriously, this is pretty difficult. 2 years ago, we took a room on a lark,
but we got the LAST room in a hotel
about 40 miles away. It's worth it though, I don't know where you're coming
from, but if you haven't done dayton
before, it's a blast, and you can't bring enough money :)

There is no 11m ham band. Do you mean to say that you have a cb radio
for 11m or that you have a ham radio that has been modified for 11m?
But unless a modified ham radio for 11m has also been so modified that
it only puts out 5 watts ... it is NOT legal.

it is not legal to use any radio on cb unless it has been type acepted
so a qrp ham rig on 11 meters is still not legal

Ummm..

It sounds like this person is from another country (Italy) and that
his english may be a bit confusing to you. I would have responded with
a question for clarification. My interpretation is that he is a ham on
2 meters, and he also has an 11 meter CB rig that he talks on. I am
sure there are hams who have both in this country too.

Hey,

I used to be able to pick up the space shuttle on 145.300 (a local repeater)in the Chicago area. They seemed to stop this around STS-75 or so. Does anyone out there know about a new frequency I might find this on??

Marty kb9smr

1002. RS-15 is one strange bird

Source record: 16234

Here in EM80 (Marysville Ohio) RS-15's beacon is loud.......Stronger than RS-12's...But the transponders outputs are in the dirt. CW seems to be OK, particularly when someone is trying to answer back in code....Who ever it is SLOW DOWN...I can only copy 5wpm...:-)

Tried .380 down but no ones there.

1003. FO-20 and FO-29 Activity

Newsgroup: rec.radio.amateur.space
Date: 1998-04-29 00:00:00 UTC
From: treynolds@email.exide.com
Message-ID: <6i82c1thn1@nnrp1.dejanews.com>
Source record: 16235

In the past six months I have become an active user of RS12/13 and have found that I enjoy sattelite operation very much. Now I am looking around for other sattelites and the FO20 and FO29 birds look like good candidates. I realize they won't be quite as easy as RS12/13 but before I invest money in UHF equipment I was wondering if anyone on the news group could tell me how much activity there is on these two sattelites, as compared with RS12. Presently I don't have any ability to receive on 435 MHz, other than my HT.

Thanks and 73s
Tom

1004. How long left to work MIR?

Newsgroup: rec.radio.amateur.space
Date: 1998-04-29 00:00:00 UTC
From: John Charles <jaycee@midmarsh.demon.co.uk>
Message-ID: <NDkaZLAWy4R1EwkE@midmarsh.demon.co.uk>
Source record: 16236

I saw a brief mention on teletext here (UK) that starting next month (May) that Mir is to be slowly nudged out of orbit and that it is expected to burn up at about the same time that the new space station is in operation.

Any more info available anywhere on this?
Did I misunderstand or misread this? I can't check it as the teletext pages are changed every day.

Well, 100kc's is allot more roomy than 50....

I worked FO-20 for the first time today, linked up with some individuals in Utah, I am in Ohio...Doppler at those freq.'s is heck! I lost my own signal numerous times...

The cool part is so far I have not had to invest in any yagi's or rotors. I am running on turnstiles alone, and doing OK.

SpaceNews
=========

MONDAY APRIL 27, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* AMSAT-OSCAR-10 NEWS *
======================
Stacey Mills, W4SM, reports that AMSAT-OSCAR-10's solar illumination
appears to be extremely low, and the satellite is "nearly comatose" as
a result. Stacey reports hearing the beacon with FM'ing as well as his
own downlink with some FM'ing as well, but the signals are very, very weak.

This is in keeping with his best guess regarding the spacecraft's attitude,
which shows less than 50% illumination at the moment. Given the aging
solar panels, that's probably enough to cause significant performance
degradation.

Things will probably continue to get worse for the next month and may not
be any better by the time of field day. However, they should improve again
later in the summer and peak in August.

If this cycle produces a complete "loss of signal", Stacey may be able
to more closely estimate the ALAT/ALON of the satellite and improve the
illumination predictions.

[Info via Stacey Mills, W4SM]

* TECHSAT LAUNCH NEWS *
======================
Assi Friedman, 4X1KX/KK7KX reports that a 1998-Jun-23 to 1998-Jun-24
launch date has been confirmed for the TecSat-1b satellite by the
Techsat team. A telemetry decoding program for use with Techsat
is expected to be released soon.

TechSat-1b will be very similar to the TechSat-1a satellite (lost
shortly after launch) in the communications modes. It will use 9600
Baud FSK (like UO-22/KO-23/KO-25) and have VHF/L-band uplinks, with
the downlinks in the UHF band. Users of the current fleet of 9600

baud satellites should have no problem accessing TechSat-1b after
its launch.

* SHUTTLE TRACKING WEB PAGE *
==========
Dr. Tom Clark, W3IWI, reports that an Internet Web page is available
to those wishing to track the current Space Shuttle mission. The URL
for this page is:

http://shuttle.nasa.gov/ftpwmap/wmap.gif

The page reloads every 5 minutes with updated tracking data. Visitors
may need to hit the [RELOAD] button on their browsers to receive updates.

The top line shows the <Day-of-Year and UTC time for the update>, followed
by the <MET (Mission Elapsed Time)>, <Position> and <Height>.

The shuttle.nasa.gov site has a description of the display available at:

http://shuttle.nasa.gov/demos/worldmap.html

* WHY IS THE SKY DARK AT NIGHT? *
==========
An Internet Web page that attempts to explain why the sky is dark at night
is available at the following URL:

http://www.arachnoid.com/sky/index.html

The answer may not be as obvious as one might think! :-)

1007. Duluth, MN Shuttle Repeater?

Newsgroup: rec.radio.amateur.space
Date: 1998-04-29 00:00:00 UTC
From: "Christopher W. Buckley" <cwbuckle@mtu.edu>
Message-ID: <6i64c9$76f$1@campus1.mtu.edu>
Source record: 16429

Just wondering if anyone knows a repeater in the Duluth, MN area from which I could listen to the Space Shuttle from. If not, is there a common frequency from which I could pick it up when it is overhead?

Thanks,

Chris
KC0DBY

Hi David,
I have been on the analog VHF/UHF birds now for about three years and as
far as I know I am the only operator in FM16 on those birds on a regular
basis. My antennas are down right now but I hope to be back up in a
couple of weeks or so. Log on to the amsat web site at www.amsat.org
and you can follow the links to all the info you need.

I'm sure you misunderstood. ISS won't reach permanent habitation
status before 2002. MIR will need several boosts to stay in orbit that
long. The Russians are committed to maintaining a continuous manned
presence in space. I'm quite sure they won't let MIR's orbit decay before
ISS reaches permanent habitation status. (Unless MIR becomes
uninhabitable before then, of course.)

Hmm. It appears I was hasty in this matter. I've now seen the same
report, and it does say MIR's orbit is to be lowered in preparation for
discontinuing operations sometime in 1999.

Over the U.S. Mir uses 145.985, over Europe and elsewhere they use the other 2. This crew of cosmonauts rarely gets on, Andy however DOES but finds it noisy and crazy over the U.S. so he rarely comes on here, except to work schools. I DID hear him 2 days ago looking for Miles Mann about a TNC failure during the APRS school test. (It's back up now).

>>

Not a bad idea ... considering that the ARRL represents only about 22
percent of the US Hams. The FCC may have thought it wise to hear from
the other 78 percent.

Where do we send our comments to the FCC ? What is the deadline for
comment?

Spread the word at ham club meetings.

1026. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-05-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6ib7qe$9hu@news.Hawaii.Edu>
Source record: 16252
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

SB SPACE ARL ARLS008
ARLS008 SAREX scrambling to fill Mir-school schedule

With less than a month to go before US astronaut Andy Thomas must return to Earth from the Russian Mir space station, efforts are under way to schedule as many Mir-school contacts as possible. Thomas, who's KD5CHF, is scheduled to end his tour aboard the aging Russian space outpost in early June. He*s the last US astronaut scheduled to be aboard Mir.

On tap for May so far are Mir Amateur Radio contacts with schools in New Hampshire, South Africa, Texas, and Tennessee, and others are pending. The South African contact will occur during the Africa Telecom 98 conference, to demonstrate how Amateur Radio on Mir--and eventually aboard the International Space Station--can benefit education. Attempts also are being made to firm up contact schedules with school groups in Australia. The Australian government has issued Thomas, a native of Adelaide, the special call sign VK5MIR.

Thomas has been especially active in recent months catching up on the backlog of school contacts, which were halted after serious technical problems cropped up aboard Mir in 1997. He has also managed a few casual contacts. Nearly all of the activity has been on 70 cm. The Mir crew has been preoccupied the past few weeks with repair work that included a series of space walks that precluded Amateur Radio activities.

By the way I always get the packet on 145.9850 in the UK and very often
get russian voice on 143.6250 but I have never yet heard anyone speaking
english, does anybody know of any times when anyone talks english while in
area of europe/uk it would be nice to hear before she eventually goes.
perhaps they talk occasionaly on a freq that I have missed?.

Hi all,
I have just recently looked into getting the magellan GSC100 h/h
gps/sat e-mail unit. What i was wondering is has anybody
picked up transmissions from these birds before ?, and can it
be decoded. I think it uses X.400 ccit addressing but i am
not sure what could decode that software wise, anybody know ?.
Any ideas
Thanks in advance
Ian.

1033. Re: antennas for RS-12,15

Newsgroup: rec.radio.amateur.space
Date: 1998-05-02 00:00:00 UTC
From: Waldis Jirgens <waldis@effect.net.au>
Message-ID: <01bd75b6$f08b4a80$36621ecb@waldis.effect.net.au>
Source record: 16259

Hi Wayne,

You wrote:
> Just getting back into satellite work and looking for some ideas as to
> what antennas seem to be most favorable to work RS-12 and RS-15.

RS-12 can be worked with 30W PEP and a quarter wavelength vertical for the uplink (2m) and any antenna for the downlink, though 2 switchable ones (horizontal/vertical) are better. If you try mode K, any GP for the uplink will do. It's very sensitive.

RS-15 is more of a problem, though recently I got a reasonable downlink signal in SSB with the 30W when using a 10 el CP yagi (az- and el-rotatable). Downlink antennas as RS-12.

Hope that helps. 73 de Waldis, VK1WJ.

1036. MIR de-orbit

Newsgroup: rec.radio.amateur.space
Date: 1998-05-03 00:00:00 UTC
From: ian.koenig@ensign-net.com
Message-ID: <894159537@ensign-net.com>
Source record: 16262

Hi all,
Well that was a shock to my system , hearing that the russians are
going to de-orbit MIR ready for closure and I presume burn-up next
year is this correct?, and if so WHAT am i going to listen to for
the 3 years after that, until the sarex missions during construction of ISS
come about and then permeneant habitation ,nothing it seems :-(
sadness !

I hope if anything makes it to earth a bit falls in my garden
as a souvineer :-).

Ian.

Hi all,
Alittle while ago I asked if anybody knew of a regular posting to any group
that gave a ragular update to what amatuer sats are working and their details
I still have not seen any such list after being told that it does get posted..
anybody else got any ideas?...i only have mail access at pres and no web so
it has to be a group or mail list
thanks
Ian.

1038. Re: Weather sat conditions ?

Newsgroup: rec.radio.amateur.space
Date: 1998-05-03 00:00:00 UTC
From: Christopher Cox <cobox@netexp.net>
Message-ID: <01bd7642$1c3fbc20$8060b6cd@cbx-nt>
Source record: 16264

Hi Ian,

This is via the Amsat page, my suggestion is you join the fine organization!

AMSAT.ORG Mailing Lists
The mailing lists offered by AMSAT's mail server AMSAT.ORG provide a way for you to regularly have certain kinds of information delivered to you by email. The lists are divided by type of information. You can choose from the following public mailing lists:

ANS - AMSAT News Service
This mailing list carries official news releases from the AMSAT News Service. These messages are posted in a form suitable for direct posting to a packet radio BBS system. Each message contains a Bulletin Identifier (BID), which permits the message to be introduced into the packet network at many places without resulting in duplicate bulletins at any BBS. The primary purpose of this mailing list is to distribute ANS bulletins for redistribution (via the packet net or on AMSAT voice nets), but individuals may also subscribe for their own use. If your local packet BBS doesn't seem to get the ANS bulletins reliably, you are encouraged to post the ANS bulletins yourself.

Only authorized AMSAT News Service personnel should send messages to the ANS mailing list.

AMSAT-BB - AMSAT Bulletin Board
This mailing list carries general AMSAT information. This information may NOT be suitable in content for transmission via amateur radio, so automatic reposting of AMSAT-BB messages to packet radio BBS's is discouraged. The purpose of this mailing list is to provide a forum for general discussion of any satellite-related topic.

Anyone may send messages to the AMSAT-BB mailing list. Simply address your message to amsat-bb@amsat.org, and it will be automatically forwarded to all subscribers to the AMSAT-BB mailing list.

Editors of publications should ask permission of the sender before publishing anything seen in AMSAT-BB elsewhere, unless the posting was obviously a public press release. However, posters should realize that anything posted to AMSAT-BB is essentially public.

KEPS - Keplerian Elements mailing list
This mailing list carries official postings of Keplerian element sets for satellites of interest to radio amateurs. Like the ANS bulletins, these messages are posted in a form suitable for direct posting to a packet radio BBS.

Keplerian elements are typically posted to this mailing list weekly, on or about Friday. Both two-line NASA format elements and verbose AMSAT format elements are posted.

Only authorized AMSAT News Service personnel should send messages to the KEPS mailing list.

SAREX - Shuttle Amateur Radio Experiment mailing list
This mailing list contains information and press releases pertaining to SAREX missions. This mailing list is very active during SAREX missions, and can be fairly quiet in between missions.

The NASAINFO mailing list has been deleted.

To subscribe to one or more mailing lists from AMSAT.ORG, send a message with your request to listserv@amsat.org. Be sure to include your callsign (if any), your correct email address, and the proper names (shown above) of the mailing lists you wish to receive. Your request will be processed manually for now, so the format of your request is not important. You need not be an AMSAT member to subscribe to mailing lists. Some further details can be found in AMSAT.ORG Frequently Asked Questions (FAQ).

In addition to these public mailing lists, several private mailing lists exist. These might be for AMSAT Board of Directors members or for PACSAT control stations, for example. If you have a need for a private mailing list for some AMSAT-related purpose, send mail to listserv@amsat.org for more information.

AMSAT.ORG also offers a Mail Alias service.

Feedback to KB5MU.

Mir

SAFEX II 70cm Repeater

Uplink 435.750 MHz FM with subaudible tone 141.3 Hz
Downlink 437.950 MHz FM
Not operational at this time.

SAFEX II 70cm QSO Mode

Uplink 435.725 MHz FM with subaudible tone 151.4 Hz
Downlink 437.925 MHz FM
Semi-operational.

Packet Radio PMS

Uplink/Downlink 145.985 MHz FM, 1200 baud AFSK
Operational. The modem is a Kantronics KPC-9612 Plus, Revision 8.1.

Chris Edmondson, VK3CE, reports working Andy Thomas, VK5MIR, on voice recently. Chris reports they spoke for quite a few minutes, with Andy saying he was very busy, although he hoped to spend a while longer at the mic. KC2BBU monitored a R0MIR voice contact on April 24th at 15:00 UTC. Costa, CT1EAT, reports working Andy recently on 145.985 MHz with 5X9+20 signals. WB4APR reports from the US Naval Academy Satellite Lab that during the annual review (and) while the Admiral in charge of Naval Space Command was touring the facility, WB4APR conducted a completely at random two-way chat with Andy. Bob reports most of the VIP's at the Naval Academy were in attendance, and yes, they were impressed. Bob says that even the best planning could never have accomplished this kind of luck, adding, "thank you ham radio!"

[ANS thanks the MIREX team for Mir status information]

RS-12

Uplink 145.910 to 145.950 MHz CW/SSB
Downlink 29.410 to 29.450 MHz CW/SSB

Operational, mode KA. The 15m ROBOT is operational.

RS-15

Uplink 145.858 to 145.898 MHz CW/SSB
Downlink 29.354 to 29.394 MHz CW/SSB

Semi-operational. CW appears to be the most successful mode on RS-15. AB2CJ has been QRV on RS-15 CW recently.

RS-16

Beacons (only) are operational. The 29 MHz beacon has not been operational for some time. Recent attempts to command the Mode A transponder on have been unsuccessful.

Transponder information:

Uplink = 145.915 - 145.948 MHz
Downlink = 29.415 - 29.448 MHz
Beacons = 29.408 , 29.451 MHz
Pwr 29 MHz Down = 1.2 W / 4 W

Beacon 1 = 435.504 MHz
Beacon 2 = 435.548 MHz
Pwr 435 MHz Beacons = 1.6 W

AO-10

Uplink 435.030 to 435.180 MHz CW/LSB
Downlink 145.975 to 145.825 MHz CW/USB

Semi-operational.

Stacey Mills, W4SM, reports solar illumination on AO-10 appears to be way down and the satellite is nearly "comatose." W4SM can hear the beacon (with FMing) and can hear his downlink as well, but the signals are very, very weak.

This condition is in keeping with W4SM's best guess regarding attitude, which shows less than 50% solar panel illumination at the moment. Given the age of the panels, that's probably enough to cause significant performance degradation.

Things will probably continue to get worse for the next month and may not be any better by Field Day. However, they should improve again later in the summer and peak in August.

W4SM has more information about the satellite on his AO-10 web page, using the following URL:

http://www.cstone.net/~w4sm/AO-10.html

[ANS thanks Stacey Mills, W4SM for his AO-10 status information and web site]

AO-27

Uplink 145.850 MHz FM
Downlink: 436.792 MHz FM

Operational. Widely used especially during weekend passes.

Eddie, N5JGK, will be active via AO-27 from the rare grid square of EM41 on Saturday, April 25th.

[ANS thanks Eddie Pettis, N5JGK, and Michael Wyrick, N4USI, AO-27 Control-op for this update]

FO-20

Uplink 145.900 to 146.000 MHz CW/LSB
Downlink 435.800 to 435.900 MHz CW/USB

Operational. FO-20 in mode JA continuously.

[ANS thanks Kazu Sakamoto, JJ1WTK for his FO-20 status reports]

FO-29

Voice/CW Mode JA

Uplink 145.900 to 146.000 MHz CW/LSB
Downlink 435.800 to 435.900 MHz CW/USB
Operational.

Digital Mode JD

Uplink 145.850, 145.870, 145.910 MHz FM
Downlink 435.910 MHz FM 9600 baud BPSK

Not operational, the satellite is in JA (voice) mode.

Kazu Sakamoto, JJ1WTK, tells ANS that FO-29 was switched into mode JA because of 2 bit errors detected in the digital operation of the on-board-computer. Resetting and reloading software into the OBC will resume. FO-29 will stay in mode JA until a further notice. An updated status announcement will be made on April 28th.

[ANS thanks Kazu Sakamoto, JJ1WTK, for this report.]

KO-23

Uplink 145.850, 145.900 MHz FM
Downlink 435.175 MHz FM, 9600 Baud FSK

Operational. Jim, AA7KC, reports the satellite is operating normally.

[ANS thanks Jim Weisenberger, AA7KC, for this report]

KO-25

Uplink 145.980 MHz FM
Downlink 436.500 MHz FM, 9600 Baud FSK

Operational. Jim, AA7KC, reports the satellite is operating normally.

[ANS thanks Jim Weisenberger, AA7KC, for this report]

OSCAR-11

Downlink 145.825 MHz FM, 1200 baud PSK
Beacon 2401.500 MHz

Operational.

In response to many requests for information about methods of decoding OSCAR-11 signals, Clive, G3CWV, has added a package of information to his web site. The site also contains some software for capturing data and decoding ASCII telemetry and WOD. The URL is:

http://www.users.zetnet.co.uk/clivew/

Excellent signals have once again been received from the 145.826 MHz beacon.

The 435.025 MHz beacon is normally off. However it can sometimes be heard when the satellite is being commanded by ground control. The data transmitted is mainly binary.

The mode-S beacon is on, transmitting an unmodulated carrier, but telemetry indicates that it has partially failed, delivering half output power.

Beacon reception reports should be sent to g3cwv@amsat.org.

[ANS thanks Clive Wallis, G3CWV, for this information.]

AMSAT-OSCAR-16 (PACSAT)

Uplink 145.900, 145.920, 145.940, 145.860 MHz FM, 1200 bps Manchester FSK
Downlink 437.0513 MHz SSB, 1200 bps RC-BPSK 1200 Baud PSK
Beacon 2401.1428 MHz.)

Operating normally. The telemetry is nominal. The S band transmitter is
off.

Time is Sat Apr 25 13:08:58 1998 uptime is 1315/07:37:41
Baseplt Temp 1.814 D RC PSK BP Temp 1.814 D

Total Array C= 0.330 Bat Ch Cur= 0.002 Ifb= 0.040 I+10V= 0.288
TX:010B BCR:84 PWRC:59E BT: A WC:25 EDAC:4A

General information and telemetry WOD files can be found at
http://www.arrakis.es/~ea1bcu/wod.htm

[ANS thanks Miguel A. Menendez, EA1BCU, for this report.]

DO-17 (DOVE)

Downlink 145.825 MHz FM, 1200 Baud AFSK
Beacon 2401.220 MHz

Currently non-operational.

The 145.825 MHz and 2401.220 MHz downlinks are off the air. Command
stations are working on the problem.

[ANS thanks Jim White, WD0E, for this update]

WEBERSAT (WO-18)

Downlink 437.104 MHz SSB, 1200 Baud PSK AX.25

Currently non-operational. WO-18 is in MBL mode after a software crash.
Attempts are being made to find and correct the cause of the suspected
seasonal crashes. Additional information is not available at this time.

[ANS thanks the WO-18 Command Team for this news.]

LUSAT-OSCAR-19

Uplink 145.840, 145.860, 145.880, 145.900 MHz 1200 bps Manchester FSK
Downlink 437.125 MHz SSB, 1200 bps RC-BPSK

Operating normally. The telemetry is nominal.

Time is Sat Apr 25 12:23:30 1998 uptime is 1039/22:18:20

TX:01A BCR:7D PWRC:36E BT:3C WC: 0

General information and telemetry samples can be found at:

http://www.arrakis.es/~ea1bcu/lo19.htm.

[ANS thanks Miguel A. Menendez, EA1BCU, for this report.]

UO-22

Uplink 145.900 or 145.975 MHz FM
Downlink 435.120 MHz FM 9600 Baud FSK

Operational. The satellite is operating normally.

[ANS thanks Chris Jackson, G7UPN / ZL2TPO, Groundstation and Operations Manager of UO-22, for this report.]

IO-26 (ITAMSAT)

Uplink 145.875, 145.900, 145.925, 145.950 MHz FM
Downlink 435.822 MHz SSB, 1200 Baud PSK

Operational.

Telemetry is downloaded on 435.822 MHz at 1200 baud PSK.

[ANS thanks Alberto Zagni, I2KBD, ITAMSAT Mission Director for this information]

[Please send your Satellite or News reports to the ANS Editors at ans-editor@amsat.org, or to ANS Editor Dan James, NN0DJ, at nn0dj@amsat.org.]

Is there a way I can listen to satellites on this unit???.
If so is there software that can be purchased or downloaded to
get the signals?.. I am getting into this scanning I have several radios
but I would be open to suggestions for what type of scanning devices I
need to do this with.

Alaska is alot like Georgia, well-kept log cabins with neatly
trimmed lawns sit next to plywood shacks and rusting trailers with
yards full of blue tarps, junk cars, and various works in progress!

Alaska has over $23,000,000,000 (twenty-three billion dollars) in
the Permanent Dividend Fund. Enough to send every man, woman, and
child to Hawaii for a week. But do you think that the roads will

get fixed, NO!

1043. Starting out w/ sat.'s...help?

Newsgroup: rec.radio.amateur.space
Date: 1998-05-03 00:00:00 UTC
From: slash502@aol.com
Message-ID: <1998050317322500.NAA04810@ladder01.news.aol.com>
Source record: 16269

I am just starting out w/ this satellite thing. I got my tracking program and it is acurate because I checked it with someone else. I have a Yaesu FT-50R w/ a premium RD-98 antenna on it. It is over 1/2 wave on 70 cm. I think I heard some fuzz a couple of nights ago when it was a 40deg. elev. That is all I heard of it in the past day or 2. Is it true that the satellites are turned of at night, which makes em' un-workable??? I just need a good satellite "elmer". All replies would be greatly appreciated. Thank you very much in advance. Please send all replies to: slash502@aol.com

1044. AO-27 Help?

Newsgroup: rec.radio.amateur.space
Date: 1998-05-03 00:00:00 UTC
From: Michael Smith <mjs@now-online.com>
Message-ID: <6iinb3$7e2$1@news10.ispnews.com>
Source record: 16270

Hello,

I heard that people have worked the AO-27 with there HT's. If that is the case, could I work it with a 2M and 70cm base antenna? And where could I find out when it is over head? I got a couple shareware programs (pc-track and sts satelite orbit) and I haven not been able to set them up to run. I think I am missing some info to make them work.

Thanks

Mike

Ho> get the signals?.. I am getting into this scanning I have several
Ho> radios but I would be open to suggestions for what type of scanning
Ho> devices I need to do this with.

IK> I have the same and i listen to the following,

MIR space station packet radio on 145.9850 nfm

Noaa 12 and 14 weather sats on 137.5000 nfm (12) and 137.6200 nfm (14)

MIR voice you can hear on 143.6250 in russian

There are many more sats you can pick up including the amatuer one's
some are listed below.

RS-12
Uplink 145.910 to 145.950 MHz CW/SSB
Downlink 29.410 to 29.450 MHz CW/SSB

RS-15

Uplink 145.858 to 145.898 MHz CW/SSB
Downlink 29.354 to 29.394 MHz CW/SSB

AO-10
Uplink 435.030 to 435.180 MHz CW/LSB
Downlink 145.975 to 145.825 MHz CW/USB

AO-27
Uplink 145.850 MHz FM
Downlink: 436.792 MHz FM

If you need more info you could join the Amsat mailing list and the group
themselves...I am.

I find that because of the narrow bandwidth of the AR8000 compared to a "
proper" weather sat reciever the only way to get a reasonable picture is
1) use a crossed dipole ariel
2) tune to about 30khz above the spot frequency and as the sat moves over
you tune downwards and try to keep the tone signal as pure as possible, a
bit of practise helps your results

As for the software you can get a lot free and some of it is very good
For start you will need a satellite prediction programme so you know
when a sat is coming over you, I reccomend WINORBIT you will find this
about on several websites or search engines you will need to d/load what

are known as " keplarian elements", these are a set of numbers that allow the programme to predict the path/location etc etc of the various sats. You can get up to date "keps" from HTTP://WWW.GROVE.NET/~TKELSO/

For decoding the satellite images I can reccomend WXSAT, a windows prog that decodes weather sat images and also HF FAX images too.
For decoding packet radio from MIR you will need either a hamcomm interface and a little dos prog called PKTMON1.2 or a proper packet modem which is a bit more expensive but will produce better results.

If you need anymore info try looking at AMSAT UK web site at HTTP://WWW.MCC.AC.UK/AMSAT/

They are a pretty helpful bunch in this newsgroup as I have found to my delight, so you should not have too much trouble finding any other information you may need.

regards
Ian Koenig.

Not sure if this is what you're looking for, but the Liftoff site on the
Internet will allow you to see the passes of the satellites. The address
is

http://liftoff.msfc.nasa.gov/realtime/JTrack/

I have found that you can usually load up the page, and then disconnect
from the internet. The elements don't usually get updated but once or
twice a day anyway.

Yes Mike,
The ARRL expects us to be like a bunch of spineless jellyfish and roll over, take whatever they shove down our throats! Look at what happened to our 220 Mhz. band, after that cluster#*@!, 220 Mhz. popularity went right down the tubes...new equipment is next to nothing and used equipment is bringing top dollar. UPS then decides not to play on the 220 Mhz. band. Another case of payoffs and kickbacks in Newington, CT.! I wish the ARRL would spend more time protecting our bands instead of selling us out.....

Why is it so that when I switch on the computer, I get lots of distortion on my HAM radio ? Is this because of same frequencies ? How should I get rid of this problem ? Any suggestions will be appreciated.

1052. NOAA Weather Sat's, Other Sat's- How?

Newsgroup: rec.radio.amateur.space
Date: 1998-05-04 00:00:00 UTC
From: "Christopher W. Buckley" <cwbuckle@mtu.edu>
Message-ID: <6ikb19kvu1@campus1.mtu.edu>
Source record: 16275

When I updated my Keps from AMSAT, it said "All Satellites of Interest to Radio Amateurs" somewhere, but there are a lot of Sat's in there I can't find any reference for, like MET sats, and then the NOAA weather sat's are in there too.

Does anyone have any quick tips about where to find information of how to receive from the weather sats, or what some of the other satellites are?

Someone really ought to put up a web page!
(hmm, weekend project?)

Thanks,

Chris

Tried RS-15 on a couple of passes Sat. and Sun.... beacon is strong, with DEEP fading, heard a KF4 calling on 29.380, but so weak I could never get his complete call. Could hear my tune-up signal, but could not copy my voice on the downlink, nor find my CW signal.....

Did, however, make two contacts on RS-12/13 on Sun. VERY strong downlinks, and 5-4 and 5-7 reports with just 50 watts and my mag mount on the car for the uplink!!! (still don't have the Eggbeater back up...) Even better sigs than I remember on RS-11. (Chris: one of the contacts was W8TRX in Waverly, OH....)

The AMSAT list only includes the amateur satellites, not weather satellites (which are not generally considered "amateur").

The current VHF APT weather satellites receivable from here are NOAA-12 (137.5 MHz), NOAA-14 (137.62 MHz) and Meteor 3-5 (137.85 MHz). Keps from all the usual sources (e.g. Celestial).

Ian I have only recently started copying Wx Sats. But they do appear to be
off at certain times. I have thought they may be switched on/off by an
ground station to conserve power etc. But this is only a guess.
The NOAAH Sats do send Infra Red pics so they operate at night too. I have
copied their pics at night. Not very interesting though. You need a Rx
which has a wide bandwidth. I use a Uniden Bearcat which is fairly basic and
is not very selective, which helps. The bandwidth of the transmissions is
about 35 Khz.
MET Sats do not provide such good quality pics for my purpose so I tend to
ignore them now. Also I have problems with the "White" part of the
transmitted spectrum from these satelites. This could be caused by
the bandwidth limitation. If someone can confirm this I would appreciate a
comment

>Well that was a shock to my system , hearing that the russians are
>going to de-orbit MIR ready for closure and I presume burn-up next
>year is this correct?

Apparently. The whole space station thing has become decidedly irrational. If it's not worth building a new orbiter around Mir, or at least keeping it going until the ISS is ready, then the ISS isn't going to be worth the immense cost in resources, and vice versa.

The only logical explanation is politics--the Russians want to get rid of what to them is a resource and public relations liability, while NASA makes it look as though its priority is a big, expensive project to keep their jobs going until they can take early retirement. From the point of view of (at the very least) resource economy, laying the foundations of a Martian colony would have made more sense.

It looks as though we will reach the millenium with no manned presence in space--only the promise of an ISS which is still a long way off and which could still be cancelled or downgraded when it goes overbudget.

>, and if so WHAT am i going to listen to for
>the 3 years after that, until the sarex missions during construction of ISS

>sadness !

There are still operational amateur satellites. Not the same thing, though. :-(

>I hope if anything makes it to earth a bit falls in my garden
>as a souvineer :-).

One would have thought that there was enough interest in Mir to have made it worth turning it into paperweights or ashtrays. The revenue would keep Boris Yeltsin in vodka for at least a month. :-)

Mir is not just a resource liability, it is way, way beyond its design
lifetime and almost nothing on board still works nominally. You just
can't operate these things forever. With ISS coming along, Russia
can't operate two stations and can't build enough Progress or Soyuz to
service two stations -- indeed, probably can't even build enough to
service one.

Pssssst! Piero! In case you hadn't heard, the ARRL *OPPOSED* the
reallocation of 220MHz. But, don't let little things like "facts"
get in the way of a good rant.

Have a happy day,

MD

Hello there. I am sure you must realise that there are absolutely
hundreds if not thousands of web pages from people monitoring the
weather satellites. Pick up a copy of Satellite Times (USA) or Short
Wave Mag (UK) to see specific columns on the subject (which I confess
to writing) and have a look at the many webpage which summarise
equipment required.

Good luck.

Progress is basically a unpressurized version of Soyuz and is launched
with basically the same type of booster (R-7, A series or whatever it
is called) as was the Vostok and Sputniks. Also the early Soviet Moon
probes and Molnya communication satellites (the P3D is planned for a
"Molnya" orbit) was launched with the same type of booster, but with
an added upper stage. Some old estimates said that the Molnya comsat
weighted about 1600 kg. I haven't seen the total launch mass for P3D
(including internal propellant), but I guess the that it would tax
heavily on the booster launch capacity.

>Just a thought! They have been good enough to provided us with the RS
>birds, why not contract their services to loft our big one.

Some RS satellites were just instrumentation packages bolted to a
primary payload, some even got the power from the main satellite.

I do not know, if the Molnya launch fairing can handle multiple
payloads, in all list I have checked, the Molnya comsat was always the
only payload launched. To get cheap launches as a secondary payload
(basically replacing sandbags to set the center of gravity), there
must be a paying customer as the primary payload. The P3D is a big fat
bird and I guess that the paying primary payload would have to be
lighter to fit within the launch capacity of the Molnya booster.

The situation is different on Proton or Ariane-5, where the primary
payload could be heavier.

Shrug. Take your pick: either we pay full commercial rates, which
means it's unlikely we would ever launch anything, or we try to
sweet-talk folks into letting us hitchhike into orbit. We have
good relations with ESA, and they have the launch hardware. It's
just taking a bit longer to sort than the instant gratification
crowd would like.

Besides, we've paid ESA a fair chunk of change here, just not anywhere near what a commercial payload would cost. It was budgeted and paid. At this point you can think of this as if we have sort have paid for a "stand-by" seat on an airplane. We've paid the money, we can't get it back, but we've not paid full fare (cause we just don't have it) so we have to be a great deal more flexible than other passengers.

I don't know if you have ever flown stand-by, but it is very difficult to watch the full fare passengers boarding the plane and knowing you may not be getting on this flight. Fortunately, once you board, they treat you like everyone else.

Now ARSENE was in someone's garage for years (close to a decade, if I remember correctly) before it flew. The French AMSAT community was extremely patient. I hope that we don't have to be that patient, but they did set quite an example.

I think we are a bit beyond instant gratification. I have allot of faith in the old Soviet Block boosters. If they are looking for money and we have some, sounds like a deal. I just do not know how much it would cost, but I would imagine TONS less than a paid for lift on one of NASA's or ESA's birds.

But its a moot point if we have nothing to offer. Beggars cannot be chosers....:-)

Worked Nova Scotia and Florida from my front yard here in Ohio on a FT-50RD and a whip.

I latter was working a OM in Chicago via F029(No, not on a FT50... a FT847) and he said "Oh, your the one I heard working AO27 from his front yard...."

Ya just gotta love technology!

Well, it is true that russians intend to burn up this good old MIR space station next year...

But remenber, the international space station will be bring in space soon (first part this year, in July I guess) and so you will hear VERY interesting traffic as soon as 1999 !

If you think this is the way to do it, what are you waiting for?
Do it.

The parameters are clear: a timely launch of 500 kilos to
geosynchronous transfer orbit, at a price AMSAT can afford.
The time and money required must include the cost of
reengineering and requalifying P3D (designed for Ariane 4/5)
for a new launch vehicle.

If you can deliver, you will make many people very happy.
Go for it!

1087. FT-736R CAT system

Newsgroup: rec.radio.amateur.space
Date: 1998-05-07 00:00:00 UTC
From: James Cutler <jwc@stanford.edu>
Message-ID: <3552051E.C95BCC53@stanford.edu>
Source record: 16213

I am working with my FT-736R using the CAT system to set frequencies, control modes, etc. However, I cannot change bands when operating in full
duplex mode through the CAT system. For instance, the radio defaults with
the receive frequency in the 2m band and the transmit frequency in the 70cm band. I want to swap bands between the received and transmit frequency.
I cannot do this with the CAT system. I have to close the CAT connection,
manually hit the REV button, and then open the CAT system again.

Is this a "feature" of the FT-736R or a quirk in mine? Does everyone have this
problem? Is there a way around it?

Thanks for your advice...

--Jamie Cutler
jwc@stanford.edu

PS...All the other CAT commands are working properly. Also, I can change bands in half duplex mode, just not in full duplex.

I also hope (and trust) that the P3D group will not send up the
10-year-old spacecraft without updating it to the state of the art once
a launch opportunity is finally available...

(of course, the P3D spacecraft is a bit less prone to outdating than
ARSENE with its famous 1200 bps AFSK packet payload)

Sure, but paid-for lifts on a NASA or Arianespace booster have never been
a realistic option, have they?

What is interesting is the price ratio between a paid-for lift on a Russian
booster, when compared to a "free ride" (paying only a small fee) on
an Ariane 5.

I expect you will find we cannot afford the Russian option in that case.

Radio Meteor Observation Bulletin No. 57 May 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Barcelona, Spain (01 59' E, 41 21' N)
Frequency: 48.250 MHz
Transmitter location: most likely Czech television C2 C. Budejovica,
100 kW, horizontal polarisation.
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (100 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT and
"Data Capture" software with 9 second/18 sampling interval to
store all the > 1.0 s signal increases.

| Apr 1998

Notes:
. no reliable data stored between April 5-12.
. * Lyrids maximum on April 22.
. ? possibly affected by sporadic-E or FAI.

Enric Fraile Algeciras

--------------------------------------------------------------------------------
Observer: Michael Boschat
Location: Halifax, Canada (63 36'W, 44 39'N, 58 meters above sea level)
Listening Frequency: 83.25 MHz
Receiver: Icom R-10
Antenna : resonant dipole
Antenna Direction: Horizontally polarized with lobes in E-W plane, elev 0 deg
```

Filter : high-Q (Q at least 300) bandpass filter between antenna & receiver.
Listening Mode: AM
Recording method: listening by ear

Mike Boschat

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00

66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 deg (= E),
elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

April 1998

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:
. ? probably affected by sporadic-E, direct reception.
. local time = UT + 2 hours.
. * warning for relative high number of long duration reflections,

an indication for potential stream activity.
. Lyrids activity on April 21-23, with peak activity on April 22, 4-5h UT.
. eta Aquarids during the last days of the month.

Maurice De Meyere / via Jeroen Van Wassenhove

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

1091. Radio Meteor Obs. Bull. Apr 1998: Lyrids 2/2

Newsgroup: rec.radio.amateur.space
Date: 1998-05-07 00:00:00 UTC
From: steyaert@vvs.innet.be
Message-ID: <steyaert.171.35522DE9@vvs.innet.be>
Source record: 16217

Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 2 element Yagi, direction northwest, no elevation at 2m height.
Receiver: IC-706 at 53.76065 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km, direction south and 2) a 30 kW TV video carrier from Sicilia, Italy, distance 900 km, south. The total echo power of both transmitters is processed into same 40 Hz virtual receiver channel.

Observing method: automatic setup using FFTDSP42t software by AF9Y to record the audio signal. 20 channels of 2 Hz width are used for meteor identification, pictures with interference, sporadic-E, E-layer and FAI propagation are manually rejected. Sampling interval: one 4096 point FFT every 0.5 seconds.

The meteor counts below are corrected for a full hour observing time. If the recording duration is 20-40 minutes, a dot is shown after the value, to show the reduced accuracy. Results for less than 20 min. observing time are excluded.

Counts of reflections longer than 6.5 seconds: assumed to be overdense.

| Apr 1998
```

Notes:
. the Lyrids showed up as a minor shower on April 22-23.
. blank value means either system down time due to earthquake, power
cut-off and data processing time.
. the first short episodes of E-layer and FAI propagation from April 21-26.
. local time conversion: 2 hour ahead of UT (04h00 UT is 06h00 local)

Werfried Kuneth

Observer: Sadao Okamoto
Location: Damine Meteor Observatory, Japan (137.53 E, 35.07 N)
Transmitter: HAM beacon (JA9YDB) for RMO (50 W CW, 53.7500 MHz) by
JA9BOH Kimio Maegawa. No modulation except for identification.
Antenna: 2 element Cross Yagi 4 dBi aiming to Zenith. Omni-directional
in azimuth and elevation above 15 deg elevation.
Location: Fukui-NCT at Sabae city (136.2 E, 35.9 N)
At present time about 10 observers are listing for
Kimio Maegawa's 53.75 MHz beacon.
Receiver: IC575
Antenna: 2 element Yagi, pointed to the zenith.
Observing method: FFTDSP software, manual count.

Hourly echoes over 10 dB SNR

Notes:
-: lost counts because of high noise level or machine failure.
@: hourly rate estimated by effective observation time less than 60 min.
n: contamination due to radio noise.
e: contamination due to sporadic E opening.
f: no data available due to TX or RX failure.
JST = UT + 9 h
There was a lot of sporadic-E interference.
But the distinct Lyrids peak could be detected in the long duration echoes.

Sadao Okamoto / via Kimio Maegawa

--------------------------------------------------------------------------
Observer: Chikara Shimoda
Location: Asahi, Nagano, Japan (137 51' E, 36 07' N)
Frequency: 81.4 MHz
Transmitter Location: FM-Japan 81.3 MHz, 10 kW, distance 180 km.
Antenna: 5 element Yagi directed to the zenith.
Receiver: AM-FM Tuner (TRIO KT-1100)
Observing method: Meteor echoes output from center-tuning meter were
recorded on a pen-recorder chart.

2. ANNOUNCEMENTS

2.1. The demise of the East European FM-band

For 40 years, a unique situation with regard to commercial FM broadcast exists
in Europe. Western Europe uses the band 88-108 MHz, the former East Block
uses 66-73 MHz. The 66-73 MHz is not used for other purposes in Western
Europe. This enables radio amateurs in Western Europe to tune to stations in
Eastern Europe beyond line of sight without any local interference: an ideal
situation to conduct meteor forward scatter using powerful FM stations.

However, this situation will cease, as FM stations in Eastern Europe are switching to the 88-108 MHz band. See e.g. the experience of Ton Schoenmaker and Wim Zanstra with Wroclaw (Poland) described in RMOB9801.
Ton learned from e-mail with Poland International that Poland will have moved completely to the 88-108 MHz band by Jan 1, 2000.

Any information about move plans and dates in other countries (in particular Hungary) is welcome.

Alternatives are TV stations (more difficult to identify) or beacons in the 50 MHz band (rather weak).

Thanks for your cooperation

Ton Schoenmaker / Chris Steyaert

2.2. Recent article

From astro-ph daily, supported by the U.S. National Science Foundation:

From: Luigi Foschini <l.foschini@fisbat.bo.cnr.it>
Date: Mon, 27 Apr 1998 13:42:30 GMT
Title: On forward scatter of radio waves from meteor trails
Authors: Luigi Foschini
Comments: 17 pages, 6 figures; submitted to Planetary and Space Science
In this paper, a new approach to forward scatter of radio waves from meteor trails is exposed. The attention is drawn to some macroscopic characteristics of a meteor plasma and it is shown that electron-ion collision frequency is not negligible, as commonly thought. A simple formula for calculations of radio waves maximum attenuation after the forward scattering is also presented.

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

If you want to work AO-27 with an HT, get a 146/438 Arrow Antenna hand-held yagi. That's what the serious satellite operators use when operating AO-27 portable. You can order direct from Arrow (add $50 and they'll install a special duplexer in the handle for use with dual-band HTs), or from AES if you want to use a credit card. You might be able to work it with a long HT antenna in a quiet area, but you're better off with a mobile on a simple (low-gain) antenna. Gain omni's are great for terrestrial use, but won't work very well for satellites (except on low elevation passes). HT's may do fine in Europe but AO-27 is pretty busy on weekdays and on weekends, you may not be able into AO-27 at all with an HT, especially on the transcontinental passes.

Hi all,
I was wondering about when they de-orbit MIR next year will they be
bringing much equipement back with them like mir packet radio stuff etc?.
and for that matter all the other stuff that is still good on her !.

Also, I wonder if there will be any sort of "speech" from the last
crew to be on MIR on the 2 metre band voice or packet...would be nice to
keep as a recording or txt for posterity ?.

And on a lighter note:

And i was also wondering if the last person off will turn the lights out
and flush the loo ;-)

Ah well, I know i'll miss her, sniff sniff :-(!.

Ian Koenig.

Now that makes sense. What I don't understand is why the major (and for that matter minor) manufacturers of satellite oriented gear aren't providing more support. They feed off the sats. Why don't they support them? Or maybe they do anonymously ;>) Bill, W2BY

Hi James,

The 736r can't "swap" bands under computer control, without
a third band module, due to the limitation against having
both Satellite VFO's on the same band (even for a short time.)

If you have a third band module, such as 220, or 6 meters,
you can load an intermediate frequency in one VFO, then load
the 2 frequencies you want, but there is no direct way to
implement the "REV" key under CAT control.

Hi Everyone,

I need to make ONE satellite QSO during Field Day to get the bonus points.

I think the easiest way is to work RS12, 10 metes/2 meters.

Can this satellite be worked with a 10 m dipole and 100 watts and a 2 meter dipole and 150 watts?

Would appreciate any guidance regarding other satellites that might be easier to work also.

Thanks de Art (newbee satellite user).

INTERSTATE BALLOON TO BALLOON REPEATER LINKUP

On May 9 Bill Brown, WB8ELK, will launch a balloon in Alabama
simultaneously with the WINDTRAX balloon in Indiana. If the
idea works, signals on 2 meters originating in the upper
Midwest will be linked by 440 to the Alabama balloon, retransmitted,
and be audible over a large part of the Southeast. In any event,
barring adverse weather, balloon signals from 10 meters to
73 cm should be heard Saturday over a giant swath stretching all
the way from the Great Lakes to the Gulf of Mexico.

For specific information on this launch, check out the project websites:

http://fly.hiwaay.net/~bbrown/ WBELK

http://www.windtrax.org/ WINDTRAX with live online
GPS balloon tracking

For launch notices for all balloon events, including the above
interstate project, Canadian and European events, and the
upcoming Massachusetts HamRadiosonde launch on May 30,
please check:

http://www.geocities.com/capecanaveral/3161/hablic.htm

You don't need a lot of power when there is nothing to block the signal
path.
I have worked through AO-27 on a dual band hand held with tx power of 5
watts
and a strong downlink signal.

Take a listen to Dove on 145.825 Mhz, that is only about 1 watt.

I "talked" on ao27 today, or so I thought. I transmitted on 145.850 fm &
listened on 436.800 fm on my TM-7VA .... Or... was the tx on 2m just
overloading the rx on 70cm side??? Later , after the pass, I couldn't hear
myself anymore. The antenna was a Diamond 17foot dualbander at abt 70ft.
How much of a delay is there in the downlink? I didn't hear any. Makes me
wonder if I *did* talk on it or not. My TM-V7A cant tune much better than
436.750 or 436.800. Any thoughts? Is there a noticeable doppler on the
downlink? A delay ?

You don't need any power on 10 meters at all (it's the downlink..._) and a dipole is certainly sufficient. 150 watts up on 2 meters is WAY too much.... you'll cause the AGC on the satellite to clamp down, effectively blocking other users. Use only the minimum power necessary to hear yourself on the downlink. 50 watts should be plenty, although a turnstile or eggbeater antenna would be better than a dipole for the uplink. I worked 3 QSO's this past weekend just using the 5/8ths mag mount on my car and 50 watts up, though. My club's Field Day setup (W9CCU) will consist of 25 watts uplink on 2 meters thru computer-aimed KLM twist beam, with a full-wave loop on 10 meters for the downlink, 100 watts and KLM twist beam on 435 for AO-10, and 435 receiving capability for FO-20 and FO-29. Made 28 Q's last year without even trying RS-12 (it was in mode K last year, not KA like now...)

On the other hand, 150 watts FM up to AO-27 (assuming you have 435 FM receive capability) should net you an easy contact as well. W9CCU will be on AO-27 also.

Figure out the size of the market. There are less than 25,000 amateurs
worldwide active on satellites. It is surprising that the manufacturers
even spend the R&D money to develop rigs for us. If they couldn't count
on non-satellite users buying some of them too, they wouldn't even
break even.

I have worked a few stations through A0-27 with FT-50 and MFJ 1717 whip - I concentrate on passes when I have high elevation. Amazing to me that it does work. Usually get one really good pass per day or less.

A few recent passes seem to have had lower signal strength on downlink than before.

Well, I put a little time into it, at the encouragement of all the people here who have told me it is possible, and I refurbished a 3-element cubical quad that a local ham was nice enough to give me. It's tuned for TX on 2-meters, and with a little tweaking, I can keep the SWR acceptable on 440.

Went outside yesterday, and was able to hear AO-27 clear as can be with my AT-600 HT. Now it's just a matter of getting a word in edgewise! Usually my high elevation passes cover 90% of the U.S. so I'm trying to get into a pretty big pileup. What amazes me most though, is, I'm able to hear a satellite on an HT I bought for $200, with a home-made antenna, and I've only been a ham for a month!

Have fun with your dual band HT's!

That's mode K.... right now it is operating in mode KA, with uplinks on both 15M and 2M. With the death of RS-10, and the Russians' apparent inability to switch the transponders on RS-16 on, RS-12 will likely remain in mode KA, or be switched to mode A permanently.

I, too, had trouble hearing the satellite today. Had a nice pass,
nearly went
overhead, and I have full AZ/EL tracking. The antenna's not the best
(shorty
11 element beam, polarized vertically), but I have always had at least
part of
a pass come in full quieting. This time I got basically nothing.

Is '27 having problems?

Greg.

p.s. If you want to work Satellite during field day, your best bet
would
probably be FO-20 or FO-29. Lots of passband space. Last year there
were
so many trying to pile into AO-27 that almost nobody got in.

~~~~~~
You probably were hearing your own signal being sent back. There is
no noticable delay because the satellite is in a low orbit. The
doppler is there and if you could tune for it in small enough
increments you would be able to hear it and work it much longer.
As it is you just don't hear it except when the signal is passing
by your set frequency.
I used to work it quite a bit with my handheld (a Yaesu FT470) and
the rubber duckie from parking lots and other clear areas. You can
position the handheld so that an auto trunk or hood acts as a
reflector and improve the signal sometimes. There are a lot of
satellite hogs running 100W to large beams talking over the mobile
and handheld guys most of the time, so you have to catch a pass when
these turkeys don't happen to be on the air.
Good luck.

What is that price Amsat is willing to pay? That has been my question since day one. Like I stated before, if it is nothing, well, we are getting what we paid for. I certainly am not going to approach anyone concerning a businesses transaction unable to even entertain coming through on our part.

I believe someone delivered some facts that some monies where available and given to the ESA for this. While implying that this was not much, I am not getting a clear picture as to how much monies is being received and where they are going to and for what. This is why it seems I am asking dumb questions, even from my perspective.

Congrats Chris,

As a matter of interest KD5CGU made her first ever amateur radio contact with VE6ITV via AO-27 not bad an international satellite contact for her first contact. I have worked the bird in Alaska with 400mW on the uplink. My antenna is the prototype for the current production Arrow antenna. Lok for you on the birds.

That is not a good reason. I wish I could design a radio that I could sell 25,000 copies of. I guess it all depends on your needs. if you want to make a living or if you want to make a fortune off the one product.

> -- KD6PAG

Tovar has got this just right. I have been doing hamfest demos and AO-27 dxpeditions for several years now with the prototype of the current Arrow antenna with great success. Yes you can work AO-27 with a whip but you can't work it WELL what ends up happening is the bird gets QRM from operators who can't hear the downlink well enough to know when to transmit.

On of the most irresponsible things I have seen in print is Steve Ford's repeated references to working AO-27 with an HT and a rubber duck. Unfortunately new satellite operators believe what they read in QST and end up adding to the QRM problem.

I've said it before but it bears repeating. The hardest part of working AO-27 is hearing it. If you are in the continental US and you don't hear other users the problem is with you, the satellite is in almost constant use over North America. If you can't hear it PLEASE don't try to work it all you do is step on someone else.

Just heard on of the RS satellites and I'm hooked. Will a 144meg and a 432 meg eggbeter antenna work on most of the satellites? I heard the RS ten meter downlink with a dipole in my attic, is there a better antenna for this? Any info appericated.

Hi, all.

I'm starting to get interested in purchasing a VHF/UHF multimode rig
for contesting, satellite, and packet. Any thoughts on the relative
merits of the ICOM IC-820H, Yaesu FT-736R, and Kenwood TS-790A?

I've read the feature summaries in the CQ 1996 Equipment Buyer's
Guide. (Yes, I suppose I should pick up the 1998 edition ;-)
Can anyone provide pointers to on-line reviews?

Thanks.

>
>W4SCO

It isn't a matter of making a fortune. It is a matter of keeping the
doors open. With that small a customer base, the small margin
on amateur equipment (the lowest in specialty manufacturing),
the infrequency that amateurs upgrade major station equipment
(You didn't think you'd sell 25,000 radios a year did you?),
and the fact that you have competitors, you'd be lucky to net
$90,000 a year before taxes (triple that if your competitors throw
in the towel and cede you the market). And that's company net,
not personal net.

You have to reinvest part of that net toward R&D on the next
generation product, and it costs about $250,000 a year to keep
a R&D engineer productively employed according to the IEEE
(besides salary, benefits, and taxes like the employer share of
SS, workmen's comp, etc, you have to fund equipment, lab space,
and administrative overhead). Shocked? I was when I first had to
pay it. Engineers are cheap to buy, but expensive to own. They
need computer workstations, spectrum analyzers, scopes, etc
etc etc.

You have to pay stockholder dividends out of that net (you don't
think they're letting you play with their money for nothing do you?).
And you have to set aside something to replace manufacturing
plant and equipment as it wears out or becomes obsolete.

How many companies can survive like that? How many
would even try? You'd get better ROI just putting your
stockholders' capital in the bank and letting it draw interest.
(And the stockholders won't stand for that. If you can't do
better for them than that, they'll find a new CEO.)

I find it amazing that manufacturers bother with the amateur market at all, much less the tiny part of it that is the amateur satellite community. Most certainly couldn't survive if that were their only market. Yaesu, Icom, Kenwood, etc do the majority of their business in non-amateur lines. Making amateur equipment, especially specialized amateur satellite equipment, is only a tiny portion of their business. It keeps some of their engineers happy, and it may generate some positive PR among decision makers (who may happen to be amateurs) in their primary markets. What it doesn't do is make them a fortune.

Try running a technical manufacturing business, then you'll see. You need a lot bigger cash flow than the amateur market provides if your intent is to make a fortune.

1135. Noaa-K (noaa 15) launched !!!

Newsgroup: rec.radio.amateur.space
Date: 1998-05-14 00:00:00 UTC
From: "STEVE M." <N9JGQ@worldnet.att.net>
Message-ID: <6jdm74$rc8@bgtnsc01.worldnet.att.net>
Source record: 16063

Hey wxsat junkies,
A new wxsat launched 5-13-98. It will replace Noaa 12 in a couple of
months. Here's more info....

****
****
NOAA 98-29

CONTACT: Patricia Viets, NOAA FOR IMMEDIATE RELEASE
Cynthia O'Carroll, NASA 5/13/98

NOAA-K WEATHER SATELLITE SUCCESSFULLY LAUNCHED

A new satellite that will improve weather forecasting and monitor
environmental events around the world was successfully launched today at
8:52 a.m. PDT, the U.S. Department of Commerce's National Oceanic and
Atmospheric Administration and NASA announced. All deployments were
confirmed 30 minutes after the launch.

NOAA-K, a joint project of NOAA and NASA, was launched from Vandenberg Air
Force Base, Calif., into a near-polar orbit 516 miles above the Earth on a
U.S. Air Force Titan II rocket. It will circle the Earth every 102 minutes,
passing over the North and South Poles on each orbit.

NOAA-K is the first in a series of five satellites with improved imaging
and sounding capabilities that will operate over the next 12 years. Like
other NOAA satellites, NOAA-K will collect meteorological data and transmit
the information to users around the world to enhance weather and climate
forecasting. In the United States, the data will be used primarily by the
National Weather Service for its operational long-range weather and climate
forecasts.

The design of the satellite will enable it to "scan" the Earth, and provide
continuous global images of cloud cover, surface parameters such as snow,
ice, and vegetation; atmospheric temperatures, moisture, and aerosol
distributions; and collect and relay information from data platforms.

"With NOAA-K, we will get better measurements of atmospheric temperature
and moisture values," said Mike Mignogno, NOAA's polar program manager.
"These translate into better information, particularly in the troposphere
under cloudy conditions. The result will be accurate, global, tropospheric
temperature and moisture data under all sky conditions."

"The improved cloud, snow cover and sea surface temperature data means
improved forecasts of potential flooding and drought conditions," said
Ronald McPherson, director of NOAA's National Centers for Environmental
Prediction, one of the primary users of the polar satellite data. "The

observations will also enhance the National Weather Service's ability to forecast storms such as those we have experienced during the major El Nino event, as well as the El Nino itself."

NOAA-K will also carry search and rescue instruments that are used internationally in locating ships and aircraft in distress. The use of satellites in search and rescue has been instrumental in saving more than 7000 lives since the inception of the Search and Rescue Satellite-aided Tracking (SARSAT) system.

NOAA operates two polar-orbiting and two geostationary environmental satellites. Currently, NOAA is operating NOAA-12, launched in May 1991, and NOAA-14, launched in December 1994. NOAA-K, to be renamed NOAA-15 once in orbit, will replace NOAA-12, which will be deactivated.

NOAA and NASA work together to develop and launch NOAA's environmental satellites. NASA's Goddard Space Flight Center in Greenbelt, Md., is responsible for the construction, integration, and verification testing of the satellite, instruments, and ground equipment. NASA arranges launch of the satellites with the U.S. Air Force. Following the launch, NASA turns operational control of the satellite over to NOAA after a comprehensive on-orbit verification period, which is expected to last about 60 days.

NOAA operates the satellites from the Satellite Operations Control Center of the National Environmental Satellite, Data, and Information Service in Suitland, Md.

Information on the polar satellites is available on the World Wide Web at: http://poes2.gsfc.nasa.gov and at http://www2.ncdc.noaa.gov/docs/intro.htm

Might this be a good time for AMSAT to start looking at some of the other ways to get payloads into orbit? I've started a short list at http://www.houstonspacesociety.org/entlinks.html#transport which might be helpful.

Of course, none of the alternative launch systems have much in the way of flight history. Without paying customers, most of them won't have flight history ever.

By the way, since you bring up the topic, how much is AMSAT paying Arianespace these days?

Free Yourself,

Jim

Interesting.
Are the orbital elements for this instrument available for use with Win orbit? Or is it still to early, the people in charge still fine tuning its orbit. I assume the signal encoding is the same format as the other Noaa satellites.
I have found it not only possible, but quite satisfactory to listen to Noaa 12, and 14 with a scanner (Tandy pro50), using Win orbit to predict passes, and WXsat to produce the images. The images are of perfectly good quality, even with the signal taken from the headphone socket, and into my soundcard line in. The rubber aerial with the scanner isn't much good (I reckon it's a fancy shaped dummy load), so I made a better one using 4 old car antennas arranged in a cross, each arm 51cm long, arranged as 2 1/2 wave dipoles, and joined with a 90 degrees phase shifting piece of coax (37 cm). This lot is held with the arms horizontally, and works surprisingly well, even if just placed on a picnic table outside (it works better on a pole though).

You can certainly work a good number of the LEO satellites with those antennas: RS-12 and 15 (144 up, 10M down, CS/SSB), AO-27 (145 up, 436 down, FM), FO-20 and 29 (144 up, 435 down, CW/SSB). There is a rumor that AO-21 might also be switched back on (FM, 144 up, 435 down), and the Russians are still trying to turn RS-16 on.

A better bet for your RS 10M downlink might be a full-wave loop or a turnstile.... helps to eliminate cross-polarization fading.

Good luck on the birds... I've worked about 7 stations in the last two weekends alone, from Washington state to Maine, all on 2300 - 0000 (local) passes.

I don't know if the computers on board the satellites care about Y2K, but there will be some problems with Keplerian elements at the rollover, and most satellite tracking software is probably going to have problems as well. I know that AMSAT has stated that a patch for InstantTrack will be released sometime prior to 2000 to deal with the Y2K issue. I don't know about any other programs, though......

We ride FREE, just pay a little [less than 1/30th cost]. P3D can't ride on any other system that I know of. We have a contract to ride with ESA ... and will when they decide to let us. 501 and 502 were bad anyway, what makes you think 503 will be ok? 504 would be fine with me, rather safe than sorry with all the money we hams have invested in P3D.

I think the original message post here above may be a fake anyway.
